ABOUT THE AUTHORS

1. INTRODUCTION

1.1. TERMS OF REFERENCE

WSP UK Ltd (WSP) was instructed by the Environment Agency (EA, 'the Client') to undertake a grid-based soil investigation in the area surrounding the AGC Chemicals Europe Limited (AGCCE) manufacturing facility (referred to herein as the 'AGCCE facility') located within Thornton-Cleveleys. These works form the third phase (Phase 3) of investigation being conducted by WSP on behalf of the EA, which commenced in September 2024.

This report sets out a factual account of the Phase 3 Grid Investigation undertaken between October and November 2025. Follow up reporting will provide the interpretation of the dataset, including data obtained during earlier phases, where relevant. A Sampling Location Plan is included as Figure 1 within Appendix A.

Works were undertaken under the HSE, 2015. Construction (Design & Management) Regulations (CDM) [4] where WSP were Principal Contractor and Designer.

1.2. PROJECT CONTEXT AND BACKGROUND

The investigation findings presented herein form part of a wider Part 2A inspection that is investigating potentially significant contaminant linkages that may be attributed to legacy emissions from the former ICI site, now the AGCCE facility. Aerial deposition of PFOA is considered to result from historical airborne emissions associated with the AGCCE facility and former site operators.

As part of earlier phases of works [1][2][3], a number of plausible contaminant linkages were identified attributed to legacy operations that warrant further investigation or quantification in accordance with EA, 2020, Land Contamination Risk Management (LCRM) [5] and to be compliant with investigation requirements under Part 2A of the Environmental Protection Act, 1990 [6].

The potential risk to human health from legacy aerial deposition of perfluorooctanoic acid (PFOA) in shallow soils associated with the AGCCE facility has been identified as a priority for further consideration.

The wider investigation is being undertaken through a two tracked, phased and iterative approach, defined as follows:

- Track 1 refers to the wider assessment of contaminant dispersion across the area.
- Track 2 is a more targeted Part 2A compliant assessment of specific parcels of land where evidence indicates a potentially unacceptable risk.

It is recognised that the investigation into offsite impacts and their significance in the context of Part 2A requires a phased / iterative process. The investigation of shallow soils within residential gardens across land at Thornton-Cleveleys presented herein forms part of the third phase of investigation works, comprising a combined Track 1 and Track 2 assessment.

Whilst this report considers contaminant linkages associated with health risks from potential soil contamination, the Part 2A inspection also includes other linkages of concern from the facility, including the risk to the water environment.

1.3. PREVIOUS REPORTS

- Earlier phases of works pertaining to the site are documented in the following reports:
- WSP, 17 February 2025. Desk Study: AGC Chemicals Europe Ltd Facility, Thornton-Cleveleys (ref: 70100310-12157(5) [1]
- WSP, 12 December 2024. Site at Thornton-Cleveleys, Factual Report from Preliminary Phase of Offsite Soils Investigation (ref: 70100310/12232(2) [2]
- WSP, July 2025. Residential Grid-Based Investigation, Thornton-Cleveleys (ref: 70100310/12258) [3]

1.4. REMIT

Based upon the findings of the Preliminary (Phase 1) [2] and Phase 2 [3] works a potentially significant contaminant linkage was identified between PFOA in shallow soils and residents with private gardens who grow or have the potential to grow home grown produce for consumption. Phase 3 has been undertaken to more robustly understand the potential significance of this contaminant linkage.

The Phase 3 works elements and associated remit and rationale are defined within Table 1-1.

Table 1-1 – Remit and Rationale for Proposed Sampling Activities

Phase 3 Works Elements	Remit and Rationale
Detailed (Track 2) shallow soil sampling within gardens of a select number of properties within the area indicated of higher potential deposition (south-east of facility) - referenced as 'GR03'.	The findings of the Phase 2 grid assessment indicated a potential area of high deposition oriented in the prevailing wind direction to the south-east of the facility. The maximum concentration observed (144ug/kg) at the maximum sampling radius of 500m indicated a potential for deposition extending beyond the 500m radius of investigation to date. Observed concentrations in this orientation indicate that a significant contaminant linkage could reasonably exist between PFOA in shallow soils and residents with gardens who grow or have the potential to grow home grown produce for consumption. Further detailed sampling within residential development, to a radius of 1km within the south-east orientation, was proposed to enable data validation of Phase 2 findings and extrapolation across the wider area. A statistically valid number of test locations was required per garden to facilitate Part 2A risk assessment and decision making for each plot.
Further sampling within gardens of selected properties within wider residential areas to the south, west and north to provide coverage (Track 1).	Further sampling within residential development within the south-west orientation proposed to provide coverage, enable data validation of Phase 2 findings and extrapolation across the wider area.

Phase 3 Works Elements	Remit and Rationale
Detailed (Track 2) investigation of selected properties where an exceedance of the interim C4SL was identified as part of the Phase 2 grid investigation - referenced as 'GR04'.	
Detailed (Track 2) shallow soil sampling within gardens from a selection of poultry keepers within the vicinity of the facility, including egg samples - referenced as 'POUL'.	Research and literature evidence indicates, due to the bio accumulative nature of PFAS, the consumption of home-produced chicken/poultry eggs represents an exposure pathway to poultry keepers where the poultry are exposed to PFAS in soils where they roam. To assess this exposure pathway, sampling of a selection of residential properties registered as poultry keepers within the study zone was proposed. This included representative shallow soil samples for a comprehensive Part 2A assessment, and eggs for sampling as a secondary line of evidence / key exposure route to assess impact to health. Formulation of a questionnaire to be provided to the poultry keepers to understand the amount of consumption relative to shop bought eggs, as well as details regarding the living environment that may affect the poultry exposure to potentially impacted shallow soils and/or other potential exposure routes to PFAS.

1.5. SCOPE OF WORK

The scope of works for the residential Phase 3 Grid Investigation comprised the following:

- Selection of properties to target for shallow soil sampling within gardens based on the previous phase findings, focusing on high deposition areas, lower deposition areas and poultry owners within a 1km radius of the factory. A higher density of properties were selected to the south-east (approximate 50m grid spacing). Property selection was influenced by the need for a private garden with available and accessible soft surfacing (i.e. lawn, flower beds, vegetable patch) to facilitate sampling compared to a wider spacing (200m+ beyond 500m radius of the facility) within the wider area to provide coverage. Some properties previously sampled in Phase 2 were returned to in order to generate a bigger sample size for that property (suitable for statistical assessment where a detailed Track 2 investigation was undertaken) and additional properties were sampled for the first time to increase the overall density of properties sampled. Wyre Council were responsible for contacting residents / landowners based on the identified properties to confirm they meet the criteria to facilitate sampling (available soft surfacing and no significant import or export of soils during their ownership) and for obtaining the necessary consents and access permissions ahead of sampling. All properties approached were privately owned. Where a consent for sampling was not granted, an alternative property was sought within the immediate vicinity (i.e. immediate neighbours or properties opposite or backing on).

- Review of historical maps, utility plans and unexploded ordnance (UXO) data for the area of investigation.
- Preparation of a Construction Phase Plan (CPP) [7] to include risk assessments and method statements for the proposed works, in accordance with the CDM Regulations, 2015 [4].
- Service identification and service clearance by a specialist third party contractor and provision of surveying coordinates of all exploratory hole locations.
- Shallow soil assessment within 1km radius of the AGCCE facility targeting residential properties / sample points with private gardens and known poultry keepers. Progression of between 1 and 7 hand dug pits (not including duplicates) per property / sample point by a specialist contractor to depths of up to 0.6m bgl. The number of pits varied per sample point depending on whether the sample point was located in a higher or lower potential deposition area or if it had been visited previously during Phase 2. Soil sample collection at up to three depths within the shallow vertical profile.
- Collection of duplicate samples in accordance with British Standard (BS) 10175 [9] at properties / sample points where a Track 2 investigation was proposed.
- Analysis of all soil samples obtained for a specified suite of contaminants at ALS Laboratories (UKAS accredited) comprising PFAS Broad Suite (ALS laboratory method TM440, PFOA, Perfluorooctanesulfonic acid (PFOS), Perfluorononanoic acid (PFNA) and Perfluorohexane sulfonate (PFHxS) at a limit of detection / method detection limit (LOD/MDL) of 0.5µg/kg), in addition to soil organic matter (SOM) and pH.
- Analysis of a subset of soil samples (equivalent of 10% of samples obtained) for PFOA branched and linear isomers by Mérieux NutriSciences Italia.
- Collection of eggs from properties with poultry for laboratory testing for EFSA (European Food Safety Authority) four compounds (PFOA, PFOS, PFNA and PFHxS).
- Collection and analysis of quality assurance / quality control (QA/QC) samples in the form of equipment rinsates, analysed for PFAS Broad Suite (ALS method TM434) at a frequency equivalent to approximately 10% of soil samples obtained.
- Collection of questionnaire responses from residents to establish a wide range of information including whether they: grow fruit and/or vegetables for consumption, have astro turf, have undertaken any garden landscaping works including the import/export of soils, use composts/manures for soil conditioning, and to provide background and context.
- Collection of additional questionnaires responses for poultry keepers to understand the amount of consumption relative to shop bought eggs, as well as details regarding the living environment that may affect the poultry exposure to potentially impacted soils and/or other potential exposure routes to PFAS.
- Factual reporting.

1.6. LEGISLATIVE CONTEXT AND GUIDANCE

The investigation was undertaken in general accordance with the following standards and guidance documents:

- British Standard (BS) 5930:2015 +A1:2020 Code of Practice for Ground Investigation [8].
- BS 10175:2011+A2:2017, Investigation of Potentially Contaminated Sites, Code of Practice [9] (relevant at the time of the investigation, although recently updated in 2026).
- Health & Safety Executive (HSE), 2015. Construction (Design and Management) Regulations [4].
- EA, 2020. Land Contamination Risk Management (LCRM) [5].
- Part 2A of the Environmental Protection Act, 1990 [6].
- Department for Environment, Food and Rural Affairs (Defra), 2012. Contaminated Land Statutory Guidance [11].

1.7. LIMITATIONS

The report is addressed to and may be relied upon by the EA, as “the Client” within the meaning given to that phrase within the agreement and subject to the terms and conditions contained therein.

This report has been completed with regard to generally accepted consulting practices and may not be relied upon by any other party without the explicit written agreement of WSP. No other third-party warranty, expressed or implied, is made as to the professional advice included in this report. This report must be used in its entirety.

Unless WSP has actual knowledge to the contrary, WSP has assumed the correctness and completeness of third-party information supplied and shall have no liability in respect of any inaccuracy, defect or omission in any information or materials provided, anecdotally or otherwise, by the Client or any other third party to WSP. WSP does not assume any liability for misrepresentation of information or for items not visible, accessible, present or supplied at the time of the study.

WSP’s General Limitations are included in Appendix B.

2. BACKGROUND AND SITE DETAIL

2.1. PHASES OF INVESTIGATION

A preliminary (Track 1) shallow soils investigation [2] was undertaken between September and October 2024 across 22 council owned land parcels within a 5km radius of the AGCCE facility. The results of this Track 1 investigation and an independent air dispersion modelling assessment undertaken by the EA AQMAU [12] indicated the presence of a potentially significant contaminant linkage between legacy aerial deposition of PFOA in soils and residents with gardens who grow or have the potential to grow home grown produce for consumption.

A Phase 2 (Track 1) Grid Investigation [3] was developed and completed between February and March 2025 to gain further information on this potentially significant contaminant linkage. The investigation included sampling of shallow soils from the gardens of 46 residential properties located within a 500m radius of the AGCCE facility to the south-east, south and south-west. The results of PFOA analyses aligned with the EA AQMAU dispersion modelling in indicating an area of potential higher deposition to the south-east compared to the wider areas of residential development radial to the AGCCE facility.

The Phase 3 Investigation of Residential Properties was designed to improve understanding of, and confidence in PFOA soil concentration variability seen at certain locations and across the study area in Phase 2 by incorporating the following elements:

- Track 2 investigation in the area of potential higher deposition to the south-east to the maximum extent of residential development in this orientation, within a 1km radius.
- Enhancement of the Track 1 investigation across the wider area up to a 1km radius of the AGCCE facility by increasing the density of properties sampled.
- Track 2 soils investigation at properties where poultry are kept and free to roam within open gardens, including sampling of eggs from ducks and chicken kept at those properties.

A more detailed rationale of the scope for Phase 3 is included within Table 1-1. A summary of the investigation phases and investigation track is provided in Table 2-1.

Table 2-1 – Soil Investigation Phase and Track Summary

Investigation Phase	Soil Investigation Track (see footnotes)
Phase 1	Track 1 – preliminary investigation of council owned land parcels within 5km radius of the facility (no residential properties)
Phase 2	Track 1 - preliminary investigation of residential properties to the south-east, south, south-west and west of the facility (roughly 100-150m grid spacing) within a 500m radius of the facility
Phase 3	Track 1 – enhanced preliminary investigation of residential properties within the wider area to the south, south-west, west and north-west within a 1km radius of the facility

Investigation Phase	Soil Investigation Track (see footnotes)
	Track 2 – detailed investigation of residential properties within the area of potential higher deposition to the south-east to generate a sample dataset suitable for statistical assessment Track 2 – detailed investigation of properties investigated during Phase 2 where an elevated concentration of PFOA was identified in soil (including properties to the south-east and within the wider area) Track 2 – detailed investigation of properties where poultry are kept and free to roam within the garden, including the collection of eggs from ducks and chicken kept at that property
Track 1 refers to the wider assessment of contaminant dispersion across the area. Track 2 is a more targeted Part 2A compliant assessment of specific parcels of land where evidence indicates a potentially unacceptable risk.	

The location of the land sampled as part of Phases 2 and 3 soils investigations is shown in Figure 1 in Appendix A.

A summary of the findings from the previous phases of investigation is presented in Section 2.3 and 2.4 below.

2.2. DEVELOPMENT HISTORY - GRID SAMPLING AREA

A high-level desk study review [1] has been completed of the residential areas radial of the facility where sampling has been proposed, which included review of historical land use and development history (including the potential for earthworks / ground disturbance / importing of soils i.e. associated with residential capping layers). Details are provided within Appendix C.

In summary, low rise residential development has gradually occurred over the mapping period with initial residential development being constructed between 1910 and the 1960s, with most development in this period appearing to occur to the west and south of the AGCCE facility. The industrial site was first seen on mapping from 1951. Newer housing estates seen from the mid-1960s onwards gradually expand into the eastern area until 2010, when the full current residential extent is shown.

Insert 2-1 – Phase 3 Grid Sampling Area - Approximate Residential Development History

2.3. PRELIMINARY OFFSITE GROUND INVESTIGATION (SEPTEMBER 2024)

A detailed account of the offsite Preliminary Investigation is provided within the Factual Report [2]. In summary, the works were undertaken to provide an initial indication of PFOA concentrations in shallow soil radial to the AGCCE facility at distances up to 5km.

A total of 199 No. shallow soil samples were analysed, from a range of land uses, across 22 separate council owned land parcels, including school playing fields, public open space and parks. The sampling works confirmed the presence of PFOA above the LOD in 187 out of 199 samples (representing ~94%) at concentrations up to 35.1µg/kg, suggesting widespread impact of PFOA within surrounding soils.

As previously mentioned, the available council owned land within residential areas located 500m of the facility and within modelled high-risk areas of deposition was limited and therefore the general area to the south, south-west and south-east was not sampled as part of the Preliminary Phase [2].

2.4. PHASE 2 GRID INVESTIGATION

The Phase 2 Grid Investigation was undertaken to provide further information on the plausible contaminant linkages that were previously identified as being attributable to legacy operations at the AGCCE facility. A total of 63 sample points (130 hand pits) were distributed within a 500m radius of the AGCCE facility: 35 sample points were spread across a 100m grid to the south and south-east of the facility, 15 sample points were spread across a 150m grid to the south and south-west of the facility and 13 sample points were located in public open space within the residential areas. Two hand pits were dug at each sample point and up to 3 samples collected and analysed from each pit.

PFOA levels above the LOD (limit of detection) were discovered in 287 of the 291 samples with the concentrations ranging from 0.73 µg/kg to 144 µg/kg (average concentration 4.13 µg/kg). The results align with the aerial dispersion model showing the highest concentrations to the south-east of the AGCCE facility.

The conclusion of the human health risk assessment for residential properties with homegrown produce was that an unacceptable risk to human health could not be ruled out and that further works were warranted.

Further detail is available in the Phase 2 Grid Investigation Factual report [3]. The data obtained from Phase 2 has been included within the discussion of the results within Section 4 of this report.

3. PHASE 3 RESIDENTIAL PROPERTIES INVESTIGATION

3.1. FIELDWORKS

The Phase 3 Residential Property Investigation was undertaken between October and November 2025, supervised by WSP field engineers on a full-time basis. The area subject to soil sampling is shown in Figure 1 in Appendix A.

To ensure the integrity of the samples obtained, given extremely low method detection limits associated with PFAS analysis (e.g. µg/kg dry weight (DW) or as received (AR) for soils) and the many potential sources of PFAS for cross contamination, strict operating procedures were followed to minimise sample bias (positive or negative)¹. This included the use of PFAS-free material and equipment and personal protective equipment (PPE), where feasible, the use of laboratory supplied sample containers, and the implementation of comprehensive quality assurance / quality control (QA/QC) measures, such as, equipment blanks/rinsates and duplicate samples.

Specific method statements were devised and incorporated into the design of the investigation, copies of which are provided in Appendix D.

A summary of the PFAS specific quality assurance actions taken on-site is provided within Section 3.5.

3.2. COMPLETED SCOPE OF FIELDWORK

Preparatory activities included:

- Identification of proposed Phase 3 Grid sample points and high-level desk-based assessment.
- Desk-based review of sampling areas (including history, utilities and unexploded ordnance (UXO)).
- Preparation, submission and authorisation of health and safety documentation including liaison with the Principal Designer (Mott McDonald). Access to residential properties arranged by Wyre Council.

The following fieldwork activities were conducted between 9th October and 19th November:

- Inductions and mobilisation of initial hand pitting crew and service clearance contractor.
- Completion of service clearance, hand pitting and shallow soil sample collection at 71 properties, including:
 - 35 properties to the south-east (referenced as GR03)

¹ Positive bias is the overestimation of analyte concentration and can result from contamination of samples by field equipment, materials, and sampling procedures used during sample collection, storage, and transport. Negative bias is the underestimation of analyte concentration and can result from improper field sampling procedures, using materials to which the contaminant sorbs, or sample storage conditions that could result in analyte degradation prior to analysis. (NGWA, 2023)

- 31 properties within the wider residential area (referenced as GR04), and
- 5 poultry keeper properties (referenced as POUL).
- Collection of egg samples at 4 out of 5 poultry keeper properties (referenced as POUL)
- Completion of resident's questionnaire at 71 properties and poultry keeper questionnaire at 4 properties.

The following deviations / restrictions from the original planned scope of works are noted:

- Various sampling points were re-positioned onsite to account for site constraints including the potential presence of previously unidentified underground utilities.
- The number and depth of pits progressed was also dependent upon constraints during the works, including access, available areas of soft standing, utilities and above or below ground obstructions.
- Property access was dependent on third party access agreement. Not all properties approached granted access and therefore suitable alternatives were sought within the timeframe.

All soil sampling points were positioned in areas of landscaping within private gardens, typically within lawns or flower beds. Each proposed sampling point was marked and cleared (using a cable avoidance tools (CAT) and ground penetrating radar (GPR)) by a specialist surveyor (Lucion Survey). The sampling locations were then re-surveyed via GPS to account for any repositioning (coordinates and elevations X, Y, Z). A plan showing the distribution of properties sampled within the investigation area is presented as Figure 1 within Appendix A.

3.3. HEALTH AND SAFETY

WSP acted as Principal Contractor during the ground investigation and supervised all site activities on a full-time basis. A Construction Phase Plan (CPP) was prepared prior to commencement of the ground investigation and issued to the Principal Designer (Mott McDonald) acting on behalf of the Client (the EA), for approval.

- WSP, October 2025. Thornton Construction Phase Plan (ref: 70100310-CPP300) [7].

The CPP set out the arrangements made for securing health and safety during the construction period. The CPP detailed site rules, risk assessments and method statements of all subcontractors and WSP, and specific measures put in place to mitigate the identified health and safety risks.

The CPP is to be submitted to the EA for inclusion in the Health and Safety File kept by the Client. This factual ground investigation report is part of the Health and Safety File.

During the soil sampling works, a project Suitably Qualified Person (SQP)² attended site on 15 October 2025 to observe sampling activities.

3.4. SAMPLE IDENTIFICATION

For sample identification purposes, the sample ID nomenclature comprised:

- A prefix of 'GR03' for residential properties within the area of potential higher deposition to the south-east of the facility, 'GR04' for residential properties within the wider area to the south, west and north, or 'POUL' for properties where poultry are kept.
- A sample point ('SP') reference number that is property specific (300 series for properties within GR03, 400 series for properties within GR04 and 500 series for poultry keeper properties).
- A suffix of 'A' – 'G' to represent the individual hand pits progressed at each property. Where duplicate samples were collected, the additional suffixes of 'S1' and 'S2' were added to identify the parent and duplicate hand pits respectively, and 'A1' and 'A2' to identify the two separate samples from each pit at that depth interval (e.g. to represent Sample 1 Analysis 1, Sample 1 Analysis 2 etc).
- An associated depth interval of where the sample was taken from (e.g. 0.3 – 0.4).

The egg samples collected at the poultry sample points were named with the 'POUL-SP' prefix and then given a numerical 'EGG' suffix to identify each sample (e.g. EGG01).

The sample identification details are summarised in Appendix E. The locations of the sampling points are shown in Figure 1 in Appendix A.

3.5. SOIL SAMPLING

SAMPLE DEPTH

Hand dug pits were progressed by a specialist contractor to a depth of up to 0.6m bgl (subject to access agreements, utilities and obstructions). To ensure the shallow vertical soil profile was targeted whilst continuing to align with the exposure assumptions for different land uses, at each identified hand pit, three soil samples were collected between ground level and 0.6m bgl. Samples were obtained at discreet 0.1m depth ranges, as indicated within Appendix E.

LOGGING AND SAMPLING

The sampling technique comprised hand dug pits (using insulated hand tools) whilst adopting a strict methodology for the avoidance of cross contamination or introduction of PFAS during hole advancement or sample collection. The hand pits were all positioned within areas of soft landscaping within residential gardens with no requirement for mechanical excavation or coring of the ground surface.

Geotron UK Ltd. undertook the hand pitting works which were overseen by two WSP geo-environmental engineers on a full-time basis. A written record of the soil strata was logged in accordance with BS5930:2015 by the WSP engineers and hand dug inspection pits and associated arisings were photographed. Selected photographs are included on the exploratory hole logs, presented in Appendix F. Where specified by the sampling plan (Appendix E), duplicate samples were obtained from an adjacent hand pit.

Arisings were placed on high density polyethylene (HDPE) sheeting in accordance with laboratory advice, and in accordance with the earlier phases of works [2] [3]. Discrete disturbed soil samples were extracted from arisings using a handheld stainless-steel trowel, undertaken in accordance with

the methodology described in Appendix D. Arisings were subsequently used as backfill and compacted to restore the hand pit once the samples had been collected. Samples were collected in laboratory supplied sample containers (1kg tubs) and placed within the laboratory supplied cool bags. The samples were sent by courier to the laboratory (ALS Life Sciences Ltd (ALS)) either the same day or following day.

QUALITY ASSURANCE AND QUALITY CONTROL

Due to the low screening level concentrations and prevalence of PFAS in consumer products, as stated within Section 3.1, strict protocols were followed to minimise sample bias or cross contamination of samples and to ensure the integrity of the samples collected. This included the use of PFAS-free equipment, laboratory supplied sample containers, and personal protective equipment (PPE), and the implementation of comprehensive quality assurance / quality control (QA/QC) measures, including:

- Regular cleaning of the hand pitting and sampling equipment with a liquinox solution made with laboratory supplied PFAS-free deionised water. The hand pitting equipment was cleaned between every hand pit whilst the sampling tools were cleaned between every sample collected.
- Triple rinse of tools and equipment with laboratory supplied PFAS-free deionised water.
- The changing of disposable gloves for every sample collected.
- Samples were stored in sealed containers appropriate for laboratory analysis for the required suite.

During the investigation, QA/QC samples were collected in general accordance with that outlined within Table 3-1 and described below.

Table 3-1 – Quality Control Sampling Plan

QC Sample	Description	Typical Quantity
Equipment/ rinsate Blank	E.g. sample taken of the rinse water from the final rinse after decontamination of the field equipment. Used to assess whether the decontamination process has been adequately undertaken. Or, rinse water sample taken of polyethylene sampling equipment to assess the potential for PFAS cross contamination	At an approximate frequency of 1 in 10 soil samples collected
Analytical and sampling duplicates	Duplicate samples collected in accordance with BS 10175 as described below – all samples analysed at ALS laboratories.	Equivalent to 10% of the proposed sample targets
Analytical duplicates	Separate duplicate samples collected at random and analysed at different performing laboratories	In the order of 10% of soil samples collected
Analytical QA/QC performed by the laboratory (ALS)	Internal quality processes performed by the laboratory including an analytical quality control (AQC (Spiked Sample)) run with each batch of samples	All samples analysed

The equipment rinsate samples collected as part of the Track 2 Investigation are detailed in Appendix J. In summary, 109 rinsate samples were collected during sampling at selected sample locations (equating to ~10% of soil samples collected). Rinsate samples were collected associated with use of the following equipment used during the sampling process:

- the plastic sheeting used for the temporary storage of arisings during logging and sampling;
- plastic bags used to contain egg samples within egg boxes;
- cardboard egg boxes used during egg sample transportation;
- the driller's hand tools; and
- the sampling trowels.

The results of the QA/QC rinsate testing are presented in Section 4.4.

Analytical and Sampling Duplicates in accordance with BS 10175

For the assessment and control of sampling uncertainty, duplicate sample collection, in general accordance with BS 10175, was undertaken at 44 randomly selected locations as part of the detailed soil investigation (only completed at properties where a Track 2 investigation was progressed). Insert 3-1 shows the duplicate method sampling design from BS 10175. For each duplicate sampling target a separate hand pit was progressed alongside the target. As illustrated, to account for both sampling precision and analytical precision, the duplicate sampling resulted in four separate samples being collected in the field for each target location.

Insert 3-1 - Duplicate Method Sampling Design (after BS 10175)

The national grid coordinates for each proposed sampling point were given to the specialist surveyor (Lucion Survey), who marked and cleared each location using a cable avoidance tools (CAT) and ground penetrating radar (GPR). The sampling locations were then re-surveyed via GPS to account for any repositioning (coordinates and elevations X, Y, Z).

The results of the analytical and sampling duplicates are discussed within Section 4.4.

Analytical Duplicates – Differing performing laboratories

All 113 soil samples collected for analysis of PFOA isomer speciation at Merieux Nutriscience Italia had equivalent samples collected at the same sample point and depth that were sent to a different performing laboratory, ALS laboratories UK from which a comparison of results can be made.

The results of the analytical duplicates and comment on the observed variability between samples is discussed within Section 4.4.

Laboratory Analytical QA/QC (ALS)

In addition to the above, ALS Laboratories internal Quality Processes are presented on the laboratory reports within Appendix G. This includes the results of an analytical quality control (AQC (Spiked Sample)) run with each batch of samples. The bold figure detailed is the percentage recovery result for the AQC, whilst the subscript numbers are the percentage recovery lower control limit (LCL) and upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control. Where the AQC sample fails, the batch is cancelled, and samples are re-run.

Based on the AQC's data presented within laboratory reports, recovery of 5:3 FTCA, 6:2 FTAB, 7:3 FTCA in the quality control samples has been observed to be <50% of the target value. The results for these analytes are therefore indicative only. The remaining AQC's are within the acceptable ranges and therefore pass their QA/QC. The laboratory AQC compliance shows that the extraction/analysis process worked and won't have affected the levels of the contaminants in the actual samples.

LABORATORY CHEMICAL ANALYSIS – SOILS AND RINSATES

The soil samples were collected in fully labelled laboratory-supplied containers, relevant to the required suite of analysis; and transported in cooled containers under full chain of custody to a UKAS accredited laboratory (ALS Life Sciences Ltd).

Whilst, for the purpose of this investigation, PFOA was identified as the principal contaminant of concern, a wider suite of PFAS analysis was implemented which offered the lowest MDL/LOD available for PFOA (0.5µg/kg).

Soil analysis for PFAS in the present study was not accredited (which applies to the services currently available from all UK labs). However, certain analysis methods for waters (applicable to the equipment rinsates) are validated to ISO 17025. The environmental laboratory reports are presented in Appendix G.

From the hand pits an additional 113 samples were taken for PFOA isomer speciation testing to characterise branched / linear isomer ratios. These samples were dispatched in fully labelled containers (supplied by ALS) relevant for PFAS analysis; under full chain of custody procedures to Mérieux NutriSciences Italia. The samples were taken across the depth profile from the same pits and same depths as samples sent to the ALS Life Sciences Ltd laboratory. These equivalent samples, obtained from the same hand pit, at the same depth, represent additional analytical duplicates as discussed within Section 1.5.

A full summary of the sampling and laboratory analysis undertaken during the Track 2 investigation is presented in Table 3-2 below.

Table 3-2 – Summary of Environmental Laboratory Analysis Schedule

Laboratory	Chemical Analysis	Accredited Method – Method Reference	Analysis Method	Number of Samples Analysed	
				Soil	Equipment rinsates (QA/QC)
ALS Life Sciences Ltd	PFAS Broad Suite (soil)	No – TM440	Liquid chromatography coupled with a triple quadrupole mass spectrometer (LC-MS/MS)	1,126	-
	PFAS Broad Suite (water)	Yes - TM434	LC-MS/MS	-	109
	Soil Organic Matter	Yes – TM132	High temperature combustion (ELTRA method)	1,126*	-
	pH	Yes - TM133	Automated pH meter	1,126	-
Mérieux NutriSciences Italia	Linear PFOA	Yes - MP 2222 rev 0 2017	LC-MS/MS	113	-
	Branched PFOA	Yes - MP 2222 rev 0 2017	LC-MS/MS	113	-

Only 1,125 SOM results reported as the laboratory indicated 'No Determination Possible' on a single sample (POUL-SP510-F-0.30-0.40) with the comment 'unable to confirm result'.

It is noted where samples have been diluted by the laboratory for analysis, a variation in the reported limits of detection may be observed.

3.6. EGG SAMPLING

Duck and chicken eggs were supplied by four out of the five poultry keepers where soils were sampled. Due to the time of year, some poultry had reduced or stopped laying and therefore the number of eggs provided were dependent on their availability at the time of the investigation. Each egg 'sample' comprised of between 1 and 4 eggs (of the same poultry species) that were packaged securely in PFAS free egg cartons and sent to Eurofins Food Testing UK Limited for analysis as detailed within Table 3-3. Where the sample comprised multiple eggs, the sample was mixed at the receiving partner laboratory in Sweden prior to analysis.

Samples were analysed for the EFSA four compounds (PFOA, PFOS, PFNA and PFHxS), accredited to ISO 17025.

Table 3-3 - Egg Sample Summary

Sample Description	Poultry type	No. eggs per sample
POUL-SP504-EGG1	Chicken	4
POUL-SP504-EGG2	Chicken	4
POUL-SP504-EGG3	Chicken	4

Sample Description	Poultry type	No. eggs per sample
POUL-SP504-EGG4	Chicken	4
POUL-SP510-EGG1	Duck	1
POUL-SP510-EGG2	Duck	2
POUL-SP510-EGG3	Duck	2
POUL-SP512-EGG1	Chicken	4
POUL-SP512-EGG2	Chicken	4

N/A – type uncertain due to labelling issues (duck or chicken)

3.7. QUESTIONNAIRES

RESIDENTS QUESTIONNAIRE

A resident's questionnaire was completed by each property owner/occupier of the 71 properties visited. The questionnaire comprised of 9 questions to provide a better understanding of garden use, works that have been undertaken and/or garden maintenance practices that are undertaken. It is noted that this was intended to provide a high-level indication of such practices based on current occupancy. Property ownership/occupancy varied between households and the responses to these questionnaires does not provide a complete history or detailed inventory of works undertaken or practices employed.

A summary of the responses is provided in Table 3-4. Full details of the responses are provided in Appendix H.

Table 3-4 - Summary of Responses to Resident's Questionnaire

Q1	Do you use / have you used weed suppressants?
Most occupiers did not use weed suppressants. One indicated use of cardboard, two indicated use of plastic, one indicated use of geotextile, two indicated use of herbicide and three indicated use of suppressants but did not detail what kind.	
Q2	Do you have / have you had any astro turf or faux grass?

	Six properties indicated some use of astro turf / faux grass within specific areas of the garden.
Q3	Have you undertaken any landscaping works?
	18 properties indicated some degree of landscaping works including turfing of the perimeter, raised beds or lawn, addition of planters, removal or addition of paving.
Q4	Have you imported or exported any topsoil?
	16 properties indicated some degree of soil import/export and largely associated with planters / flower beds or the import of turf.
Q5	Have you used / do you use any soil additives?
	10 properties indicated the use of soil additives, primarily comprising compost added to flower beds and the use of topsoil.
Q6	Have you used / do you use any chemical fertilisers / pesticides?
	6 properties indicated use of chemical fertilisers / pesticides including the use of 'weed and feed' on lawns.
Q7	How are plants watered?
	Most residents indicated no watering undertaken. 16 properties indicated the use of mains water for watering with one having a water butt.
Q8	Details of garden distribution?
	Garden distribution varied including lawn/grassed areas, flower beds, shrubberies, planters, paving, driveway, fixed structures including sheds and greenhouses, decking, play areas. All gardens visited had some degree of soft standing to enable sampling.
Q9	Do you grow fruit and/or vegetables for consumption?
	7 properties indicate that they grow fruit and/or vegetables for consumption.

POULTRY KEEPERS QUESTIONNAIRE

A questionnaire comprising 19 questions was completed by the four poultry keepers from which eggs were collected.

Table 3-5 - Summary of Poultry Keeper Questionnaire Responses

Q1-3	No. of Birds, Breed of hens, Age Range
	Properties kept varieties of chicken and ducks - between 2 and 20 birds – ranging in age between 6 months and 6 years
Q4	Years keeping poultry at address
	Poultry keeping at the current address was indicated to be between 4 years and over 100 years. One property did not respond to this question.
Q5	Location of birds
	Two of four properties kept their birds solely free range in the garden. Two properties combined the use of a coop/run.
Q6	Bedding material
	Bedding materials comprised wood shavings, straw and hay, where indicated.
Q7-8	What do the bird eat and how is feed provided
	Birds were indicated to eat layers pellets, mixed corn, plants, insects, fruit, bird seed, vegetables, worms. In addition, ducks were indicated to filter wet soil. Birds were fed by a combination of free range feeding, chicken feeders and metal bowls.
Q9-10	Source of drinking water and access to other water sources

	Water is generally mains supply or rainwater collection into bowls, feeders and ponds for ducks
Q11	Access to natural untreated soil
	Birds at all properties had access to natural soils
Q12-15	Weekly egg production and consumption
	Weekly egg production varied from <10 per week to >40 3 out of 4 properties indicated they gave eggs away, as well as bakery products in which eggs were used
Q16-19	Willing to provide eggs for PFAS testing, want to receive/discuss results, questions/concerns, additional info
	All parties were willing to have their eggs tested and were interested in the results. Some raised concern regarding implications of the investigation.

4. FINDINGS

4.1. OVERVIEW

The following section provides a summary of the ground conditions and general distribution of concentrations in sampled material within the Phase 3 investigation and combined Phase 2 and 3 data sets. Exploratory logs are included in Appendix F and laboratory reports are included within Appendix G.

[REDACTED]

4.2. ENCOUNTERED GROUND CONDITIONS

The recorded ground conditions and associated photographs are presented on the exploratory logs contained in Appendix F. [REDACTED]

[REDACTED] The sampling location plan is provided within Figure 1 in Appendix A.

In summary, given the residential garden land use, typical encountered ground conditions comprised the following:

- Topsoil Made Ground was predominantly described as a very soft to soft brown / dark brown / greyish brown gravelly, sandy, silty CLAY with rootlets. The gravel was generally described as subangular to subrounded fine to coarse of limestone, sandstone and mudstone. Anthropogenic gravel that included brick and concrete was often encountered. Occasionally the topsoil was described as gravelly, silty, clayey SAND. All other features of the soil were comparable to the cohesive strata descriptions. Gravel topsoil was occasionally encountered (see exploratory hole logs and property summaries for further detail). Topsoil was recorded to a depth of 0.6m bgl (maximum depth of pits); however, the maximum depth was most commonly between 0.2 – 0.3m bgl.
- Made Ground was predominantly cohesive. Generally described as soft (sometimes very soft or firm) light to dark (sometimes greyish or orangish) brown gravelly silty sandy CLAY. Gravel was subangular to rounded fine to coarse of limestone, sandstone and mudstone. Anthropogenic inclusions consisted of various materials including brick, clinker and concrete. Granular Made Ground was found less frequently and described as either gravel or sand. The gravel was generally described as various shades of brown very sandy clayey angular to subangular fine to coarse GRAVEL of limestone and mudstone. Frequent gravel sized fragments of a variety of anthropogenic materials including brick and concrete were present, with plastic fragments and occasional bitumen/ tarmacadam fragments. Some of the gravel seen was imported landscaping gravel. The sand strata are generally dark brown, orange, greyish brown or pale brown gravelly, clayey (occasionally silty) fine to coarse SAND with rootlets. Gravel was generally angular to subangular, fine to coarse limestone, sandstone, flint and quartz. Frequent gravel sized fragments of anthropogenic material including brick, clinker and concrete were observed. Made Ground was recorded to depths of 0.6m bgl (maximum depth of the hand pits).
- Beneath the Made Ground, Natural or Reworked Natural deposits (likely Tidal Flat Deposits) were recorded. Generally, these strata are described as very soft, soft or firm light greyish brown sometimes mottled grey, orange or yellowish brown gravelly or sandy or silty CLAY. Gravel was

predominantly subangular to subrounded of limestone, sandstone and mudstone. Silt and sand are also recorded as Natural / Reworked Natural with similar colour descriptions to the clay and with a mix of secondary constituents of sand, clay, silt and gravel. The Natural / Reworked Natural strata were recorded at a range of depths from 0.07m bgl as the shallowest to 0.6m bgl (maximum depth pits progressed to).

Anthropogenic inclusions were encountered within the Made Ground. These inclusions consisted of brick, concrete, ceramics, terracotta, clinker, wood or timber, bitumen/tarmacadam, glass, metal and various forms of plastic. Further details can be found in [REDACTED] the exploratory hole logs (Appendix F).

Limited volumes of groundwater were observed, often as small seepages or ingress of water encountered generally between 0.5 and 0.6m bgl (maximum depth of hand pits) within the Made Ground and Natural / Reworked Natural. Given the time of the sampling works during the autumn/winter months, saturated ground and surface water ponding was present in various gardens.

4.3. SOIL LABORATORY ANALYSIS RESULTS – PHASES 2 AND 3 COMBINED DATASETS (RESIDENTIAL PROPERTIES)

The soil laboratory reports from the Phase 3 (Track 1 and 2) investigation are provided in Appendix G. Phase 2 laboratory reports are provided in the Factual Report from the Phase 2 (Track 1) Investigation [3].

In total 1,126 soil samples collected from residential gardens were analysed as part of the Phase 3 Grid Investigation and 208 soil samples from residential gardens were analysed as part of the Phase 2 investigation. Twenty two properties from Phase 2 were revisited for further sampling as part of Phase 3, for validation purposes and to increase sample density.

Sampling was undertaken from discrete depth intervals between ground level and 0.6m bgl. During Phase 3, soil samples were sent to two separate performing laboratories for different analyses as detailed within Table 3-2. The majority of samples were sent to ALS and subject to a suite of PFAS testing (PFAS Broad Suite), pH and SOM. A subset of samples were sent to Mérieux NutriSciences Italia to be tested for PFOA branched and linear isomers. The PFOA branched and linear isomer analysis was not undertaken as part of Phase 2. All soil results are based on dry weight.

PFOA IN SOILS

A summary of detected PFOA concentrations is provided in Table 4-1 below. PFOA was encountered above the LOD within 1,116 of the total 1,126 samples tested during Phase 3 (99%) and 204 of the 208 samples tested during Phase 2 (98%). Detected concentrations (above LOD) from the combined dataset ranged between 0.60µg/kg and 181µg/kg with an average concentration of 5.91µg/kg.

The average PFOA concentrations for each property are shown within Figure 2 in Appendix A.

Table 4-1 – Summary of Detected PFOA – Phases 2 and 3

Investigation Area	Number of samples*	Number of samples with PFOA concentrations above LOD	PFOA concentration (µg/kg)			
			Maximum	Minimum (>LOD)	Mean^	Median^
GR01 (south and south-east of facility to 500m radius)	149	147	144	0.732	4.58	2.25
GR02 (south-west and west of facility to 500m radius)	59	57	10.1	0.74	3.62	3.21
GR03 (south-east of facility to 700m radius)	738	730	181	0.60	6.04	3.58
GR04 (south, south-west, west and north-west of facility to 1km radius)	286	284	30.1	0.67	4.97	3.96
POUL (select poultry keepers within 1km radius of facility)	102	102	119	1.03	11.2	4.22
Combined dataset	1,334	1,320	181	0.60	5.89	3.56

*Dataset includes duplicate sample results

^Concentrations reported below the LOD (<LOD) have been included in the calculation as equal to their LOD

PFOA with Depth

The average detected PFOA concentrations from discrete depth intervals are shown in Table 4-2 below. In accordance with previous findings from Phases 1 and 2, average PFOA concentrations appear to increase with depth across the dataset, with the biggest increase being seen between 0.4 and 0.6m depth.

Table 4-2 – Average Detected PFOA Concentration by Depth

Investigation	Average PFOA concentration (µg/kg) *^		
	0.0 – 0.2m bgl	0.2 – 0.4m bgl	0.4 – 0.6m bgl
Phase 3 dataset	5.17 (383 Samples)	5.30 (377 samples)	8.15 (366 samples)
Combined Phase 2 and 3 residential property datasets	4.75 (461 samples)	5.07 (444 samples)	7.98 (429 samples)

*Dataset includes duplicate sample results

^Concentrations reported below the LOD (<LOD) have been included in the calculation as equal to their LOD

PFOA with Distance

A plot of PFOA concentration with distance from the facility from the combined Phase 2 and 3 datasets for residential properties is provided as Insert 4-1. The plot indicates no clear correlation between concentration and distance which may be attributed to the radial spread of sample points around the facility (between 88° and 327° rotation) and the aerial nature of PFOA deposition.

Insert 4-1 - PFOA with Distance From the AGCCE facility - Phase 2 and 3 Combined Soils Datasets

PFOA with Orientation

PFOA concentration in soils with orientation of the facility (in degrees) has been plotted as a radar scatter plot in Insert 4-2. Whilst there is a greater population of samples in the south-easterly orientation (c. 100-150°), the highest concentrations are c. 120° (south-east) and 280° (west-north-west) rotation.

Insert 4-2 - Radar Scatter Plots - PFOA Concentration in S($\mu\text{g/kg}$) with Orientation ($^{\circ}$) of AGCCE facility – Combined Phase 2 and 3 Residential Soils Datasets (including (LHS) and Excluding (RHS) Poultry Keeper Property data)

PFOA concentrations in $\mu\text{g/kg}$ (dry weight)

Generated using AI

PFOA ISOMER SPECIATION

PFOA was detected above the laboratory LOD within all 113 samples (100%) sent to Merieux Nutrisciences Italia during the Phase 3 investigation, with the total PFOA concentrations in samples ranging between $0.60\mu\text{g/kg}$ and $27.32\mu\text{g/kg}$. The PFOA linear component was identified to dominate the isomer speciation ratio within samples, with the percentage of linear PFOA ranging between 95.5% and 99.6% (4.5% to 0.4% branched PFOA).

The full dataset is provided within Appendix J.

OTHER PFAS IN SOILS

As part of the wider PFAS Broad Suite, 50 PFAS were analysed including PFOA. Whilst PFOA is the contaminant of concern under investigation, Table 4-3 provides a summary of the concentrations of wider PFAS observed across the soil sample population above the laboratory LOD.

The combined dataset indicates the greatest prevalence and highest PFAS concentrations relate to PFOA with a detection frequency of 99% and an average concentration of $5.89\mu\text{g/kg}$. Of the sum of PFAS measured across all samples, PFOA made up 88.5% of the total (analyte sum/PFAS total sum*100). Other PFAS including a range of Perfluoroalkylated carboxylic acids (PFCAs), Perfluoroalkylated sulfonic acids (PFSAs) and fluorotelomers were detected more sporadically. Of these, the following were observed at a detection frequency of >5% PFOS, PFPA and PFDA (in order of frequency from highest to lowest). Total PFOS made up 4.4 % of the total, consistent with previous findings from Phases 1 and 2.

The predominance of PFOA within soils is consistent with the findings of wider shallow soil investigations within the vicinity of the AGCCE facility [2] [3]. Table 4-3 shows the relative contribution of each PFAS to the total PFAS concentration reported above the LOD.

The soil laboratory reports are provided in Appendix G, whilst tables detailing the compiled PFAS soil analysis is presented within Appendix J.

Table 4-3 –Summary of Detected PFAS Compounds in Soils

Detected PFAS Compound	Limit of Detection (LOD) (µg/kg)	Reported Range in Detected Result (µg/kg)	No. of Samples >LOD (Detection Frequency DF)	Average (µg/kg)
Perfluoroalkylated carboxylic acids (PFCAs) in order of increasing chain length				
PFBA	0.5	0.585 - 1.92	46 (3.44%)	0.96
PFPA	0.5	0.607 - 4.58	168 (12.59%)	1.21
PFHxA	0.5	0.738 - 3.6	4 (0.29%)	2.01
PFHpA	0.5	0.666 - 0.733	3 (0.22%)	0.69
PFOA	0.5-2.5	0.603 - 181	1320 (98.95%)	5.94
PFNA	0.5	0.636 - 1.52	18 (1.34%)	0.87
PFDA	0.5	0.616 - 4.56	83 (6.22%)	1.12
PFUnA	0.5	0.649 - 6.56	28 (2.09%)	1.82
PFDoA	0.6	0.789 - 3.68	16 (1.19%)	1.63
PFTTrDA	0.6	0.729 - 3.66	17 (1.27%)	1.62
PFTeA	0.5	0.795 - 2.53	10 (0.74%)	1.32
PFOSA	0.5	0.823 - 0.836	2 (0.14%)	0.82
PFHxDA	0.5	0.689 - 1.7	9 (0.67%)	1.07
PFODA	0.5	0.687 - 1.33	5 (0.37%)	0.9
Perfluoroalkylated sulfonic acids (PFSAAs) in order of increasing chain length				
PFBS	0.5	0.702 - 1.12	3 (0.22%)	0.84
Total PFOS	0.6	0.724 - 16.9	252 (18.89%)	1.55
Fluorotelomers				
10:2 FTS	0.8	1.05 - 1.05	1 (0.07%)	1.05
6:2 FTAB	10	15 - 34.3	3 (0.22%)	24.06
6:2 FTS	0.5	0.661 - 2.51	15 (1.12%)	1.36

Detected PFAS Compound	Limit of Detection (LOD) (µg/kg)	Reported Range in Detected Result (µg/kg)	No. of Samples >LOD (Detection Frequency DF)	Average (µg/kg)
8:2 FTS	0.9	1.34 - 2.27	4 (0.29%)	1.93
Other				
FBSA	0.5	0.712 - 0.712	1 (0.07%)	0.71
HFPO-TA	4.4	6.32 - 11.9	3 (0.22%)	8.2

PH

The combined datasets indicate pH ranged between 4.35 and 10 (acidic to alkaline conditions) with an average of 7.43 (neutral). It is acknowledged that there may be typical gardening practices that have been used to manage soil pH to optimise plant growth, which could be influencing pH locally.

Insert 4-3 presents the correlation of pH data against PFOA concentrations which indicates no clear correlation.

Insert 4-3 - Correlation Between pH and PFOA in Soil - Phase 2 and 3 Combined Datasets

SOM

Soil organic matter varied considerably within soil samples tested, with reported concentrations from the combined datasets of between <0.35% to 47.1% (average 4.41%). The highest reported SOM content was typically taken from topsoil / near surface samples. As indicated in Table 4-4 the

average SOM decreased with depth, with higher SOM reported in shallow intervals which is possibly attributed to the soil root zone and presence of vegetative matter. Insert 4-4 shows the correlation between soil SOM and PFOA concentration. Whilst no clear correlation is observed it is noted that average PFOA is observed to increase with depth and average SOM is observed to decrease with depth which aligns with a slight inverse correlation observed.

Table 4-4 - Average SOM (%) in Soil with Depth - Phase 2 and 3 Combined Datasets

Depth (m)	0-0.2	0.2-0.4	0.4-0.6
No. of samples*	461	443	429
Average SOM (%)	6.40	4.07	2.60

Only 1,125 SOM results reported during Phase 3 (out of 1,126 scheduled) as the laboratory indicated 'No Determination Possible' on a single sample (POUL-SP510-F-0.30-0.40) with the comment 'unable to confirm result' – see laboratory report SDG 251016-65.

Insert 4-4 - Correlation Between SOM (%) and PFOA in Soil - Phase 2 and 3 Combined Datasets

4.4. QUALITY ASSURANCE AND QUALITY CONTROL (QA/QC)

EQUIPMENT RINSATES

The test schedules from the laboratory were checked for consistency with the sampling plan and proposed analytical schedule on the day of receipt, and any errors were rectified with the laboratory within the holding time, where applicable. During the Phase 3 soil sampling, 109 rinsate samples of the field equipment and materials were taken from selected sample locations (as detailed within Appendix J) and submitted for PFAS analysis to assess whether the decontamination process has been adequately undertaken.

A QA/QC pass is indicated where concentrations in equipment rinsates are below the laboratory LOD. Upon review of the analysis, concentrations of PFAS analytes were below the LOD, with the exception of low-level concentrations reported in 13 samples as outlined in Table 4-5.

Table 4-5 – PFAS Detections (>LOD) in Rinsates - Phase 3 Dataset

Sample ID	Sample depth	6:2 FTAB µg/l	6:2 FTS µg/l	HFPO-TA µg/l	PFBS µg/l	PFHpA µg/l	PFHxA µg/l	PFHxS µg/l	PFOA µg/l	PFPA µg/l	Total PFOS µg/l
GR03-SP303-E	0.10-0.00		0.00163								
GR03-SP316-B	0.50-0.00								0.00503

GR04-SP426-A	0.20-0.10						0.00309			0.00357	
GR04-SP437-A	0.50-0.40								0.000716		
PACK-3	0.00-0.00				0.00182				0.000934		0.00201
POUL-SP511-C-S1	0.20-0.10			0.0083							
POUL-SP512-A	0.50-0.40										0.00223
POUL-SP513-E	0.60-0.00		0.00113						0.00122		0.00321

Where data is absent, concentrations were reported <LOD

Trace concentrations of various PFAS have been identified in the rinsate samples listed in Table 4-5. It should be noted that the LOD for the rinsate tests is at least two orders of magnitude lower than that of the soil tests. Therefore, for some cases PFAS is not recorded in the soil but there is trace amounts found in the rinsate (e.g. GR03-SP303-E, GR03-SP320-G and POUL-SP511-C-S1). For rinsate samples where multiple PFAS compounds show an exceedance the soil samples generally only show exceedances of PFOA (with the exception of GR04-SP421-C PFPA found in 0-0.1 soil sample, POUL-SP513-E PFOS exceedance found in 0.1-0.2 soil sample only). GR03-SP316-B soil samples show exceedances of PFAS that are not recorded within the rinsate concentrations. The trace levels of PFAS recorded within the rinsate samples is not considered to be significant in the context of the dataset and overall, the QA/QC processes were deemed effective.

The results of the rinsate samples are contained within the laboratory reports presented in Appendix G.

LABORATORY QUALITY ASSURANCE

Based on the AQC data presented within laboratory reports, recovery of 6:2 FTAB in the quality control samples has observed to be <50% of the target value. The result is therefore indicative only. The remaining AQC are within the acceptable ranges and therefore pass their QA/QC. The laboratory AQC compliance shows that the extraction/analysis process worked and won't have affected the levels of the contaminants in the actual samples.

4.5. DUPLICATE SOIL TESTING

ANALYTICAL AND SAMPLING DUPLICATES IN ACCORDANCE WITH BS 10175

To support with the assessment of the analytical data and to assess the sampling uncertainty, the results of the duplicate soil testing for PFOA (the main contaminant of concern), analysed at ALS laboratories, is presented within Appendix J with the relative percentage difference (RPD) calculated. A total of 44 duplicate pits were progressed during the Phase 3 investigation (duplicate pits were only progressed as part of a Track 2 (detailed) investigation of a property).

The evaluation of RPD acceptability considered site-specific factors, such as the non-homogeneous soil matrix encountered during sampling (i.e. Made Ground) and low concentrations associated with the determinands, resulting in some elevated RPDs.

The duplicate analysis shows a variability in the dataset between duplicate samples. Such variations are not uncommon when investigating an aerial deposition source and when considering the heterogeneity of Made Ground soils.

ANALYTICAL DUPLICATES – DIFFERING PERFORMING LABORATORIES

Similarly, the results for PFOA from samples sent to Merieux Nutriscience Italia for PFOA isomer speciation were compared against equivalent samples from the same sample point and depth that were sent to ALS laboratories (who report the PFOA linear component only) with the relative percentage difference (RPD) calculated and presented in Appendix J.

A similar level of variability was observed between the results from the different performing laboratories.

4.6. EGG RESULTS

Samples of duck and chicken eggs collected from four poultry keepers located within a 1km radius of the AGCCE facility, where soils were also tested, are presented in Table 4-6. [REDACTED]

Samples were analysed for the EFSA four compounds (PFOA, PFOS, PFNA and PFHxS). Detections (>LOD) of all four compounds were observed in all samples. PFOA and PFOS were the most prevalent substances with PFOA comprising 44% of the total and PFOS 51%. The Sum of PFAS (4) ranged between 3.4 and 46 µg/kg.

Table 4-6 - Results of Phase 3 Egg Analysis - PFAS

Sample Description	PFHxS (Perfluorohexane sulfonic acid) (µg/kg wet weight)	PFNA (Perfluorononano ic acid) (µg/kg wet weight)	PFOA (Perfluorooctanoic acid) (µg/kg wet weight)	PFOS (Perfluorooctane sulfonic acid) (µg/kg wet weight)	Sum of PFAS4 (EFSA) excl. LOQ (µg/kg wet weight)	Poultry type	No eggs per sample
POUL-SP504-EGG1	0.028	0.36	2.7	5.2	8.3	Chicken	4

POUL-SP513-EGG13	0.033	0.19	2.8	4.4	7.4	Duck	2

N/A – type uncertain due to labelling issues (duck or chicken)

5. SUMMARY

A Phase 3 (Track 1 and 2) soils investigation was undertaken between October and November 2025 within areas of residential land use up to 1km radius of the AGCCE facility, located within Thornton-Cleveleys. Works were undertaken under the CDM, 2015 Regulations [3] where WSP was Principal Contractor and Designer.

These additional works provide a continuation to the Phase 1 and 2 soils investigations undertaken by WSP between September 2024 and March 2025 [2] [3] which suggested a potential contaminant linkage between legacy aerial deposition of PFOA in shallow soils within the surrounding area and residents with gardens who grow or have the potential to grow home grown produce for consumption. Aerial deposition of PFOA is considered to result from historical airborne emissions associated with the AGCCE facility and former site operators.

In summary, as part of the Phase 3 investigation of residential properties, soil laboratory analysis was performed by ALS laboratories on 1,126 samples of soils collected comprising a suite of 50 PFAS compounds (including PFOA), SOM and pH. Concurrently an additional 113 soil samples were sent to Merieux Nutrisciences Italia to perform PFOA isomer speciation. Sampling was undertaken from discrete depth intervals between ground level and 0.6m bgl and duplicate sampling, in accordance with BS 10175, was undertaken at 44 sample points (where Track 2 investigation was completed). Due to the extremely low method detection limits associated with PFAS analysis and the many potential sources of PFAS contamination, field personnel followed specific PFAS sampling QA/QC protocols and standard operating procedures to minimise sample bias and ensure the quality of analysis results.

The combined Phase 2 and 3 results indicate that the greatest prevalence, and highest PFAS soil concentrations relate to PFOA at a 98% detection frequency. PFOA has been detected above the laboratory LOD within 1,320 out of 1,344 soil samples collected at concentrations between 0.60µg/kg and 181µg/kg (dry weight). Of the sum of PFAS measured across all samples analysed by ALS laboratories, PFOA made up 88.5% of the total. A range of other PFAS compounds were detected (including PFOS, PFPA and PFDA at detection frequencies of >5%); although, detections were more sporadic and generally reported at much lower concentrations. PFOA speciation indicates a dominance of the linear form (typically >95%).

Egg (chicken and/or duck) samples were collected from four out of five poultry keeper properties visited (poultry were not actively laying at one property). The four PFAS (EFSA four compounds) analysed were detected above the laboratory LOD in all 19 egg samples ranging from 3.4 to 46 µg/kg wet weight. PFOA (44%) and PFOS (51%) were the most prevalent substances within the eggs collected.

Follow up reporting will provide a full interpretation of the dataset in the context of Part 2A. This will include an assessment of the available lines of evidence to determine, on a per property basis and with consideration of all relevant uncertainties, whether the land meets the statutory definition of contaminated land, or whether further assessment is required before a conclusion can be reached.

7. GLOSSARY AND ABBREVIATIONS

The following terms and abbreviations have been used throughout the enclosed statement. All may be considered as common terms used on an everyday basis by Contaminated Land professionals, their definitions are presented to assist the reader and avoid ambiguity.

Above Ordnance Datum (AOD).

Air dispersion Modelling is the use of mathematical formulations to simulate atmospheric processes and predict the dispersion of pollutants.

Analytical Quality Control (AQC) refers to the procedures adopted by the performing laboratory to ensure that analytical measurements are of adequate accuracy for their intended purpose.

Asbestos containing material (ACMs). Products that have asbestos in them. Asbestos is a mineral that has been used for its fireproofing and insulation properties. Examples include construction and insulation materials, such as fireproofing, pipes, boilers, roofing, plaster, wallboard, and cement; friction products, such as brakes and clutches; heat-resistant fabrics, packaging, gaskets, and coatings.

Below ground level (BGL).

Conceptual site model (CSM). A representation of the characteristics of the site in diagrammatic or written form that shows the possible Pollutant linkages between Contaminants, Pathways and Receptors.

Contaminant. A substance that is in, on or under the land and that has the potential to cause harm or to cause pollution to the water environment.

Contaminant linkage. The relationship between a contaminant, pathway and receptor, which is identified by developing the conceptual site model ('CSM'). See also source-pathway-receptor linkage.

Contaminant of concern (CoC). Contaminants that pose an unacceptable risk to human health and the environment, as identified in the risk assessments.

Contaminated Land. Contaminated Land: defined in section 78A(2) of the Environmental Protection Act [1] as: 'any land which appears to the local authority in whose area it is situated to be in such a condition, by reason of substances in, on or under the land, that - '(a) significant harm is being caused or there is a significant possibility of such harm being caused, or; '(b) pollution of controlled waters is being, or is likely to be, caused.' OR with respect to radioactive contamination defined in section 78A(2)(as modified) as 'any land which appears to the local authority in whose area it is situated to be in such a condition, by reasons of substances in, on or under the ground, that: (a) harm is being caused, or (b) there is a significant possibility of such harm being caused.'

Construction Phase Plan (CPP) is a document that sets out the health and safety management arrangements for a project. It is a key document that details the health and safety risks associated with the construction phase of the project and the control measures that will be implemented to minimise risks or where possible, eliminate them. The Construction Phase Plan is an explicit requirement under CDM 2015.

The Construction (Design and Management) Regulations, 2015 (CDM 2015). A set of rules that aim to improve health and safety in the construction industry by managing risks from start to finish.

Harm. This means adverse impacts on the health of living organisms or other interference with the ecological systems of which they form a part and, in the case of man, includes harm to property. (Defined in section 78A(4) of the Environmental Protection Act 1990)

Hazard. A property or situation that in particular circumstances could lead to harm or pollution.

Natural drift, or Superficial deposits (formerly known as 'drift' by British Geological Survey) are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 2.6 million years from the present. They rest on older deposits or rocks referred to as bedrock.

LOD or Limit of Detection. The lower limit achievable detection as reported by the smallest amount (concentration) that can be detected with reasonable certainty using a specific analytical procedure.

Part 2A: Part 2A of the Environmental Protection Act 1990 [1].

Pathway. A route or means by which a receptor could be, or is exposed to, or affected by a Contaminant.

Per- and polyfluoroalkyl substances (PFAS). A group of synthetic organofluorine chemical compounds that have multiple fluorine atoms attached to an alkyl chain.

- Perfluorooctanesulfonic acid (PFOS)
- Perfluorooctanoic acid (PFOA)
- Perfluorosulfonic acids (PFSAs)
- Perfluoroalkyl carboxylic acids (PFCAs)
- Perfluoropentanoic acid (PFPA / PFPeA)
- perfluorohexane sulfonate (PFHxS)
- Perfluorohexanoic acid (PFHxA)
- Perfluoroheptanoic acid (PFHpA)
- Perfluoroheptyl sulphonate (PFHpS)
- 5:3 Fluorotelomer carboxylic acid (5:3 FTCA)
- Fluorotelomers (FTS)
- 6:2 fluorotelomer sulfonamidoalkyl betaine (6:2 FTAB)
- Perfluoroalkyl acids (PFAAs)

Plausible Contaminant Linkage. A contaminant linkage that may plausibly be significant but requires further quantification or investigation to confirm or refute in the context of Part 2A.

Quality Assurance / Quality Control (QA/QC)

Receptor. In general terms, something that could be adversely affected by contamination (e.g., people, an ecological system, property or a water body).

Risk. A combination of the probability, or frequency of occurrence of a defined hazard and the magnitude of the consequences of the occurrence.

Risk Assessment. The formal process of identifying, assessing and evaluating the health and environmental risks that may be associated with a hazard.

Site Investigation (SI). The collection and analysis of soil, surface water, groundwater, soil gas and other media as a means of further understanding the condition of the site and to inform the risk assessment. This investigation may be undertaken in a single stage, or a number of successive stages.

Site of Special Scientific Interest (SSSI).

Soil organic matter (SOM). The organic matter component of soil, consisting of plant and animal detritus at various stages of decomposition, cells and tissues of soil microbes, and substances that soil microbes synthesize.

Source-Pathway-Receptor linkage. The relationship between a Contaminant, Pathway and Receptor, which is identified by developing the CSM. See also Pollutant linkage.

Significant Possibility of Significant Harm (SPOSH) (a formal term within Part 2A Legislation). The following health effects should always be considered to constitute significant harm to human health: death; life threatening diseases (e.g., cancers); other diseases likely to have serious impacts on health; serious injury; birth defects; and impairment of reproductive functions. Other health effects may be considered by the local authority to constitute significant harm. For example, a wide range of conditions may or may not constitute significant harm (alone or in combination) including physical injury; gastrointestinal disturbances; respiratory tract effects; cardio-vascular effects; central nervous system effects; skin ailments; effects on organs such as the liver or kidneys; or a wide range of other health impacts. In deciding whether or not a particular form of harm is significant harm, the local authority should consider the seriousness of the harm in question: including the impact on the health, and quality of life, of any person suffering the harm; and the scale of the harm.

Unacceptable risk: means a risk of such a nature that it would give grounds for land to be considered Contaminated Land under Part 2A.

Uncertainty. A lack of knowledge about specific factors in a risk or exposure assessment, including parameter uncertainty, model uncertainty and scenario uncertainty. Parameter uncertainty refers to the uncertainty in the model parameter values, which can be due to uncertainties in the data available. Model uncertainty is uncertainty due to imperfections and idealizations made in the physical model formulation. Scenario uncertainty is uncertainty in the actual conceptual model being assumed for example in the actual exposure duration and frequency of a receptor on a site.

Unexploded Ordnance (UXO). A term for any sort of military ammunition or explosive device that failed to function as intended and still pose a risk of detonation.

NOTES AND LIMITATIONS

REPORT LIMITATIONS - GROUND AND WATER

GENERAL

1. WSP UK Limited has prepared this report solely for the use of the Client and those parties with whom a warranty agreement has been executed, or with whom an assignment has been agreed and outlined in the body of the report.
2. Unless explicitly agreed otherwise, in writing, this report has been prepared under WSP UK Limited standard Terms and Conditions as included within our proposal to the Client.
3. Project specific appointment documents may be agreed at our discretion and a charge may be levied for both the time to review and finalise appointments documents and also for associated changes to the appointment terms. WSP UK Limited reserves the right to amend the fee should any changes to the appointment terms create an increase risk to WSP UK Limited.
4. The report needs to be considered in the light of the WSP UK Limited proposal and associated limitations of scope. The report needs to be read in full and isolated sections cannot be used without full reference to other elements of the report and any previous works referenced within the report.

PHASE 1 GEO ENVIRONMENTAL AND PRELIMINARY RISK ASSESSMENTS

Coverage: *This section covers reports with the following titles or combination of titles: phase 1; desk top study; geo environmental assessment; development appraisal; preliminary environmental risk assessment; constraints report; due diligence report; geotechnical development review; environmental statement; environmental chapter; project scope summary report (PSSR), program environmental impact report (PEIR), geotechnical development risk register; and, baseline environmental assessment.*

5. The works undertaken to prepare this report comprised a study of available and easily documented information from a variety of sources (including the Client), together with (where appropriate) a brief walk over inspection of the Site and correspondence with relevant authorities and other interested parties. Due to the short timescales associated with these projects responses may not have been received from all parties. WSP UK Limited cannot be held responsible for any disclosures that are provided post production of our report and will not automatically update our report.
6. The opinions given in this report have been dictated by the finite data on which they are based and are relevant only for the purpose for which the report was commissioned. The information reviewed should not be considered exhaustive and has been accepted in good faith as providing true and representative data pertaining to site conditions. Should additional information become available which may affect the opinions expressed in this report, WSP UK Limited reserves the right to review such information and, if warranted, to modify the opinions accordingly.
7. It should be noted that any risks identified in this report are perceived risks based on the information reviewed. Actual risks can only be assessed following intrusive investigations of the site.
8. WSP UK Limited does not warrant work / data undertaken / provided by others.

REPORT LIMITATIONS - GROUND RISK AND REMEDIATION

INTRUSIVE INVESTIGATION REPORTS

Coverage: *The following report titles (or combination) may cover this category of work: geo environmental site investigation; geotechnical assessment; GIR (Ground Investigation reports); preliminary environmental and geotechnical risk assessment; and, geotechnical risk register.*

9. The investigation has been undertaken to provide information concerning either:
 - i. The type and degree of contamination present at the site in order to allow a generic quantitative risk assessment to be undertaken; or
 - ii. Information on the soil properties present at the site to allow for geotechnical development constraints to be considered.
10. The scope of the investigation was selected on the basis of the specific development and land use scenario proposed by the Client and may be inappropriate to another form of development or scheme. If the development layout was not known at the time of the investigation the report findings may need revisiting once the development layout is confirmed.
11. For contamination purposes, the objectives of the investigation are limited to establishing the risks associated with potential contamination sources with the potential to cause harm to human health, building materials, the environment (including adjacent land), or controlled waters.
12. For geotechnical investigations the purpose is to broadly consider potential development constraints associated with the physical property of the soils underlying the site within the context of the proposed future or continued use of the site, as stated within the report.
13. The amount of exploratory work, soil property testing and chemical testing undertaken has necessarily been restricted by various factors which may include accessibility, the presence of services; existing buildings; current site usage or short timescales. The exploratory holes completed assess only a small percentage of the area in relation to the overall size of the Site, and as such can only provide a general indication of conditions.
14. The number of sampling points and the methods of sampling and testing do not preclude the possible existence of contamination where concentrations may be significantly higher than those actually encountered or ground conditions that vary from those identified. In addition, there may be exceptional ground conditions elsewhere on the site which have not been disclosed by this investigation and which have therefore not been taken into account in this report.
15. The inspection, testing and monitoring records relate specifically to the investigation points and the timeframe that the works were undertaken. They will also be limited by the techniques employed. As part of this assessment, WSP UK Limited has used reasonable skill and care to extrapolate conditions between these points based upon assumptions to develop our interpretation and conclusions. The assumption made in forming our conclusions is that the ground and groundwater conditions (both chemically and physically) are the same as have been encountered during the works undertaken at the specific points of investigation. Conditions can change between investigation points and these interpretations should be considered indicative.
16. The risk assessment and opinions provided are based on currently available guidance relating to acceptable contamination concentrations; no liability can be accepted for the retrospective effects of any future changes or amendments to these values. Specific assumptions associated

REPORT LIMITATIONS - GROUND RISK AND REMEDIATION

with the WSP UK Limited risk assessment process have been outlined within the body or associated appendix of the report.

17. Additional investigations may be required in order to satisfy relevant planning conditions or to resolve any engineering and environmental issues.
18. Where soil contamination concentrations recorded as part of this investigation are used for commentary on potential waste classification of soils for disposal purposes, these should be classed as indicative only. Due consideration should be given to the variability of contaminant concentrations taken from targeted samples versus bulk excavated soils and the potential variability of contaminant concentrations between sampling locations. Where major waste disposal operations are considered, targeted waste classification investigations should be designed.
19. The results of the asbestos testing are factually reported and interpretation given as to how this relates to the previous use of the site, the types of ground encountered and site conceptualisation. This does not however constitute a formal asbestos assessment. These results should be treated cautiously and should not be relied upon to provide detailed and representative information on the delineation, type and extent of bulk ACMs and / or trace loose asbestos fibres within the soil matrix at the site.
20. If costs have been included in relation to additional site works, and / or site remediation works these must be considered as indicative only and must be confirmed by a qualified quantity surveyor.

EUROCODE 7: GEOTECHNICAL DESIGN

21. On 1st April 2010, BS EN 1997-1:2004 (Eurocode 7: Geotechnical Design – Part 1) became the mandatory baseline standard for geotechnical ground investigations.
22. In terms of geotechnical design for foundations, slopes, retaining walls and earthworks, EC7 sets guidance on design procedures including specific guidance on the numbers and spacings of boreholes for geotechnical design, there are limits to methods of ground investigation and the quality of data obtained and there are also prescriptive methods of assessing soil strengths and methods of design. Unless otherwise explicitly stated, the work has not been undertaken in accordance with EC7. A standard geotechnical interpretative report will not meet the requirements of the Geotechnical Design Report (GDR) under Eurocode 7. The GDR can only be prepared following confirmation of all structural loads and serviceability requirements. The report is likely to represent a Ground Investigation Report (GIR) under the Eurocode 7 guidance.

DETAILED QUANTITATIVE RISK ASSESSMENTS AND REMEDIAL STRATEGY REPORTS

23. These reports build upon previous report versions and associated notes. The scope of the investigation, further testing and monitoring and associated risk assessments were selected on the basis of the specific development and land use scenario proposed by the Client and may not be appropriate to another form of development or scheme layout. The risk assessment and opinions provided are based on currently available approaches in the generation of Site Specific Assessment Criteria relating to contamination concentrations and are not considered to represent a risk in a specific land use scenario to a specific receptor. No liability can be accepted for the retrospective effects of any future changes or amendments to these values, associated models or associated guidance.

REPORT LIMITATIONS - GROUND RISK AND REMEDIATION

- 24. The outputs of the Detailed Quantitative Risk Assessments are based upon WSP UK Limited manipulation of standard risk assessment models. These are our interpretation of the risk assessment criteria.
- 25. Prior to adoption on site they will need discussing and agreeing with the Regulatory Authorities prior to adoption on site. The regulatory discussion and engagement process may result in an alternative interpretation being determined and agreed. The process and timescales associated with the Regulatory Authority engagement are not within the control of WSP UK Limited. All costs and programmes presented as a result of this process should be validated by a quantity surveyor and should be presumed to be indicative.

GEOTECHNICAL DESIGN REPORT (GDR)

- 26. The GDR can only be prepared following confirmation of all structural loads and serviceability requirements. All the relevant information needs to be provided to allow for a GDR to be produced.

MONITORING (INCLUDING REMEDIATION MONITORING REPORTS)

- 27. These reports are factual in nature and comprise monitoring, normally groundwater and ground gas and data provided by contractors as part of an earthworks or remedial works.
- 28. The data is presented and will be compared with assessment criteria.

LAND AT THORNTON-CLEVELEYS

FIGURE No:
APPENDIX C
Desk Study Map

THORNTON PHASE 3 – AREA 1 (LOWER DEPOSITION)

ASPECT	DETAIL
Geology	British Geological Survey (BGS) mapping indicates that Made Ground to be present within the north of the study area associated with the wider area corresponding to the legacy ICI Hillhouse chemical works. The regional geology indicates that the study area is located on superficial deposits of quaternary aged Tidal Flats Deposits (TFD) across the majority of the study area with patches of Devensian aged Till in the northern and eastern portions. The TFD is described as unconsolidated sediment consisting of mainly mud and/or sand, while the Till is described as unsorted and unstratified drift, generally over consolidated and comprising a mixture of clay, sand, gravel and boulders. The underlying solid geology is the Kirkham Mudstone (Part of the Mercia Mudstone Group) listed as a Secondary B aquifer and underlain by the Sherwood Sandstone Group.
Land use	Limited development is visible in the earliest 1848 historical mapping, scattered farm properties and associated dams evident across the study area. In 1890 mapping an increase in residential dwellings is notable along Woodland Avenue, along with the Marsh Mill (corn) near the intersection of Fleetwood Road and schools located at the corner of Church and Marsh Roads. Increases in residential development are ongoing from 1910 until 1973 mapping where residential dwellings dominate the study area. Commercial developments are generally located along Fleetwood Road beginning to appear in 1910 mapping, with commercial/industrial buildings (e.g. smithy, schools, clinic, post office and police station) positioned at the intersections of Church Road and Woodland Avenue. Further south a sewage pumping station associated with the Thornton U.D.C was located at the junction of Fleetwood and Victoria East Roads in 1910 mapping, subsequently becoming commercial/industrial buildings (e.g. surgery and garage). King George playing fields is indicated across a large open space to the north of Victoria East Road and south of the old Marsh Mill in 1951 mapping. Subsequently this area was developed in addition to the playing fields into a nursery, allotments, bowling greens and tennis courts in later years. Fleetwood Town Football Club Training Ground is indicated adjacent to the east of the northern portion of the study area in Burn Naze. Previously this large parcel of land remained relatively undeveloped since the earliest 1948 historical mapping and was associated with Poolfoot Farm, until the northern portion was indicated as playing fields in 1967 mapping and the Fleetwood Town training facilities constructed in 2016.

Potential PFAS source in vicinity

Flood Risk

- Flooding from rivers and seas is generally indicated to be low to very low across the site, however, some sections along the Royles Brook that runs through the study area are classified as high risk.
- The Study area is situated within Flood Zone 2 (1 in 1000-year chance) and Flood Zone 3 (1 in 100-year chance).
- The highest surface water flood risk is present along the Royles Brook affecting the immediate adjacent land at the greatest risk of 1 in 30 years, greater than 1.0 meter.

Land Use

Historical industrial land use identified within the study area has included electrical infrastructure (e.g. substations), filling stations, unspecified tanks (2), refuse heaps, pipes, garages, brick field, corn mill, nursery, police station, brick field, unspecified works and pits. In the immediate surroundings (250m) of the study area to the north, west and south, historical land uses have included chemical works (AGC Chemicals Europe (AGCCE) Limited), plastics manufacturing (Victrex Manufacturing Ltd), nurseries, electrical substations, unspecified tanks, other unspecified works (Cabinet Works) and pipe infrastructure.

Current forms of industrial land use within the study area are limited to vehicle repairs and servicing, sign painting, electrical substations, sewage pumping stations, construction services, pumping station, petrol station, upholstery and gas fitting suppliers. In the immediate surroundings (250m) of the study area licensed industrial activities include the Hillhouse Generation Ltd (combustion plant) and AGCCE Limited (glass fibre, plastic and chemical manufacturing) located directly to the east and Red Marsh Industrial Estate to the north which includes a metal recycling centre, powder and coating works, vehicle repairs.

Waste

- One historical landfill is mapped under BGS records in the northern portion of the study area, adjacent to Fairclough Road listed under the address of Martin Mere, Blackpool. The waste type is unknown and is listed as no risk to the underlying aquifer. No further current or historical landfills were indicated within the study area; however, two historical landfills were identified within the immediate surroundings (250m) of the northern extents of the study area. These included one BGS mapped landfill located approximately 100m north of the study boundary, to the north of Bourne Road, with the waste type not listed. The second is mapped under Environment Agency/National Resources Wales records approximately 150m south-east of the study boundary south of Butts Road, listed as accepting household waste. Numerous historical landfills were identified outside the immediate surroundings, located approximately 500m and 800m to the north and 900m to the south east of the study boundary.
- Historical waste sites include scarp yards located in the Red Marsh Estate, a waste processing facility and thermal treatment plant associated with the former AGCCE Limited chemical works facility.
- Three licensed waste sites are located to the east of the study boundary and include Fylde Skip Hire (commercial and industrial waste), Hillhouse Recycling (physical treatment) and Nook Garage (metal recycling).
- Waste exemptions reported within the study area included two instances of sorting and de-naturing controlled drugs for disposal associated with medical clinics.

THORNTON PHASE 3 - AREA 2 (LOWER DEPOSITION)

ASPECT	DETAIL
Geology	British Geological Survey (BGS) mapping indicates that Made Ground is not present within the study area. The regional geology indicates that the study area is generally located on superficial deposits of quaternary aged Tidal Flats Deposits (TFD) with the lower eastern corner located on Devensian aged Till. The TFD is described as unconsolidated sediment consisting of mainly mud and/or sand, while the Till is described as unsorted and unstratified drift, generally over consolidated and comprising a mixture of clay, sand, gravel and boulders. The underlying solid geology is the Kirkham Mudstone (Part of the Mercia Mudstone Group) listed as a Secondary B aquifer and underlain by the Sherwood Sandstone Group.
Land use	Limited development is visible in the earliest 1848 historical mapping, scattered farm properties, a school and a chapel are evident along Victoria East Road, in addition to the London, Midlands & Scottish Railway running approximately north to south through the centre of the study area. Increases in residential development are ongoing from 1910 until 1973 mapping where residential dwellings dominate the study area. Commercial/industrial developments were generally located along Victoria East Road and the London, Midlands and Scottish Railway between 1891 and 1930. This included a smithy, nursery, the Thornton-Cleveleys' railway station and a goods stations located along Lawson Road. Further commercial/industrial developments were observed beginning in 1930 mapping at the corner of Victoria East and Fleetwood Roads including a depot and sewage pumping station, with a building listed under Kia-Ora located further south along Fleetwood Road. An ambulance station is also later present at this corner in 1967 mapping.
Potential PFAS source in vicinity	<u>Flood Risk</u> ■ Flooding from rivers and seas is generally listed as low to very low, however, sections along the Railway Line associated with Hillylaid Pool that are classified as high risk. ■ The Study area is situated within Flood Zone 2 (1 in 1000-year chance) and Flood Zone 3 (1 in 100-year chance). ■ The highest surface water flood risk is present along Lawsons and Briar Road affecting the immediate adjacent land at the greatest risk of 1 in 30 years, greater than 1.0 meter. <u>Land Use</u> The study area has historically supported industrial land uses including electrical infrastructure (e.g. substations and pylons), nurseries, a garage, an ambulance station and unspecified tanks (2). In the immediate surroundings (250m) of the study area to the north, historical land uses have included chemical works (AGCCE Limited) and plastics manufacturing (Vitrex Manufacturing Ltd). Recent forms of industrial land use within the study area are limited to electrical equipment and servicing, electrical infrastructure (e.g. substations), gas infrastructure and construction services. In the immediate surroundings (250m) of the study area licensed industrial activities include the Hillhouse Generation Ltd (combustion plant) and AGCCE Limited (glass fibre, plastic and chemical manufacturing) located directly to the north and Red Marsh Industrial Estate to the north which includes a metal recycling centre, powder and coating works, vehicle repairs. <u>Waste</u> ■ No current or historical landfills were indicated within the study area; however, a historical landfill (household waste) is located approximately 20 m south of the study boundary. ■ Historical waste sites include scarp yards located in the Red Marsh Estate, a waste processing facility and thermal treatment plant associated with AGCCE Limited to the north. ■ Waste exemptions reported within the study area included one instance of sorting and de-naturing controlled drugs for disposal associated with a pharmacy.

THORNTON PHASE 3 - AREA 3 (HIGHER DEPOSITION)

ASPECT	DETAIL
Geology	British Geological Survey (BGS) mapping indicates that Made Ground is not present within the study area. The regional geology indicates that the study area is located on superficial deposits of quaternary aged Tidal Flats Deposits (TFD) across the western portion and Devensian aged Till located in the eastern portion of the study area. The TFD is described as unconsolidated sediment consisting of mainly mud and/or sand, while the Till is described as unsorted and unstratified drift, generally over consolidated and comprising a mixture of clay, sand, gravel and boulders. The underlying solid geology is the Kirkham Mudstone (Part of the Mercia Mudstone Group) listed as a Secondary B aquifer and underlain by the Sherwood Sandstone Group.
Land use	Limited development is visible in the earliest 1848 historical mapping, scattered farm properties and dams, with the first residential developments appearing in 1930 historical mapping (e.g. Stanah Gardens). A furniture manufacturer labelled 'billiard table works' is visible in the centre of the study area north of Hillylaid Road along Stanah Road, from 1930 until 1951 mapping. Increases in residential development are visible in 1981-1985 mapping, with development encroaching the western portion of the study area up to Hillylaid Road. Further residential development encompasses the remaining study area in 2010 mapping.
Potential PFAS source in vicinity	<u>Flood Risk</u> ■ Flooding from rivers and seas is generally listed as low to very low, however, sections along Hillylaid Pool that are classified as high risk. ■ The Study area is situated within Flood Zone 2 (1 in 1000-year chance) and Flood Zone 3 (1 in 100-year chance). ■ The highest surface water flood risk is present along Stanah Road affecting the immediate adjacent land at the greatest risk of 1 in 30 years, greater than 1.0 meter. <u>Land Use</u> Limited historical industrial land use has operated within the study area, the features identified were limited to a billiard table works, electrical infrastructure (e.g. substations) and an unspecified tank. In the immediate surroundings (250m) of the study area to the north, historical land uses have included chemical works (AGCCE limited) and plastics manufacturing (Vitrex Manufacturing Ltd). Recent forms of industrial land use within the study area are limited to electrical infrastructure (e.g. substations, pylons), aviation engineers, unspecified works and moorings. In the immediate surroundings (250m) of the study area is the Hillhouse International Business Park to the north, including chemical processing facilities. Hillhouse Generation Ltd (combustion plant) and AGCCE Limited (glass fibre, plastic and chemical manufacturing) are located directly to the north-west. <u>Waste</u> ■ No current or historical landfills were indicated within the study area; however, a historical landfill (inert waste) is located approximately 115 m north-east of the study boundary. ■ Historical waste sites include scarp yards located in the Red Marsh Estate, a waste processing facility and thermal treatment plant associated with AGCCE Limited to the north-west. Also, approximately 450 m to the north a historical recycling facility is located, associated with AGCCE Limited. ■ Waste exemptions reported within the study area included one instance of sorting and de-naturing controlled drugs for disposal associated with a pharmacy.

Appendix D

STANDARD OPERATING
PROCEDURE

METHOD STATEMENT – Collection of Eggs

Project Name:	Land at Thornton-Cleveleys	Project Number:	70100310
This document is to be read in conjunction with	• T480 – Site Risk Assessment for the works. • Construction Phase Plan. • Site Documents Pack (including contractor Risk Assessments and Method Statements (if applicable), COSHH assessments, proposed exploratory hole plan and exploratory hole and sampling schedule). • Permit(s) to Dig		
Purpose	The purpose of the Method Statement is to describe the procedures that should be followed in the collection of eggs for per- and polyfluoroalkyl (PFAS) analysis. This Method Statement includes the following: • Sample collection procedures • Sample container and packaging considerations • Sample shipping requirements • Field equipment and personnel decontamination procedures		
Equipment:	• PPE and powder-free nitrile gloves • Tablet (or other method for taking logs and notes including stationery)/ weather writer* clipboard or somewhere to store drawings and paperwork. • Pens* / pencils. • PFAS free packaging for shipment. • Camera (separate to phone or tablet if necessary). • PFAS free deionised water for rinsing equipment.		
Responsibilities:	The lead engineer/site manager and all site personnel have the shared responsibility to oversee and ensure that egg sampling for PFAS analysis is undertaken in accordance with the methodology set out in this SOP. The lead engineer/site manager should ensure all site personnel understand and comply with this SOP.		
PFAS specific requirements	<i>*PFAS SPECIFIC CONSIDERATIONS: Items within the method statement marked with an asterix (*) indicates where consideration should be given to the potential for the influence of positive and negative sample bias¹ relating to PFAS. Note, research indicates that the most likely pathway for sample bias is through direct contact between sampling equipment and the sample. Examples are provided below.</i> • Equipment: - o Weather writers, waterproof paper and other equipment comprised of waterproof materials should only be used in inclement weather. Such items should be kept separate from sampling equipment and gloves changed between use of equipment and interaction with the samples. - o Use of waterproof pens including permanent markers and dry wipe markers should be avoided. - o Sample containers should be supplied by the laboratory and specifically for PFAS analysis (Only use high-density polyethylene (HDPE) or polypropylene containers with unlined plastic caps). - o Packaging for shipment to be PFAS free • PPE: Consideration in the use and selection of PPE should also be given to the potential for the introduction of PFAS into the sampling process e.g. - o Waterproof fabrics can contain PFAS and should only be worn in inclement weather. If worn, all precautions should be taken to avoid contact between the		

¹ Positive bias is the overestimation of analyte concentration and can result from contamination of samples by field equipment, materials, and sampling procedures used during sample collection, storage, and transport. Negative bias is the underestimation of analyte concentration and can result from improper field sampling procedures, using materials to which the contaminant sorbs, or sample storage conditions that could result in analyte degradation prior to analysis. (NGWA, 2023)

METHOD STATEMENT – Collection of Eggs

	sample and the waterproof fabric. E.g. Sample container should not be stored or transported in coat pockets. Recommended material for field clothing and PPE may include waterproof clothing that contains polyurethane, polyvinyl chloride, wax-coated fabric, rubber, or neoprene. The use of waterproof clothing during sample collection should be documented in the site diary with the refined sampling protocols to be adopted. - o Disposable gloves to be changed frequently. Hands should be washed with PFAS-free soap and new, clean disposable gloves should be donned prior to the collection of each sample. - o Application of sunscreen or insect repellents to be undertaken outside of the working area and hands thoroughly washed with PFAS free soap prior to re-entry. Use should be documented in the site diary with the refined sampling protocols to be adopted. • Food and cosmetic products: General consideration to be given to the potential for introduction of PFAS into the sampling process e.g. - o Food products and packaging can contain PFAS. Food should be consumed outside of the working area and packaging disposed of appropriately. Hands to be washed thoroughly with PFAS free soap after consumption or handling of food or food packaging. - o Fabric detergents and cosmetics can contain PFAS. Contact between skin or clothing and the sample should be avoided. - o Disposable gloves to be changed frequently. • Disposable powder-free nitrile gloves must be worn at all times and a new pair of nitrile gloves are to be worn prior to the following activities at each sample location: - o Contact with laboratory-supplied sample containers or PFAS-free water containers. - o Sample collection. - o Contact with packaging. - o After the handling of any non-dedicated sampling equipment or contact with non-decontaminated surfaces.
Detailed Methodology of works to be carried out: <u>Prior to Mobilising to hand pit locations.</u>	• All personnel should wear PPE* as stated in the site-specific instructions/Risk Assessment. • COSHH assessments for all materials used on site should be available. • All staff are to be briefed as to their responsibilities and aware of the safety measures in place during the works.
Egg Sampling Procedures <u>Sample Collection</u>	Individual eggs are to be collected from the poultry nesting area by the poultry keeper in order to prevent site personnel from entering into close quarters with the birds and so eggs could be collected over a longer period of time than a single visit from site personnel. Clean powder-free nitrile gloves to be worn when handling eggs. The eggs collected are to be stored in such a way as to maintain distinction between eggs from different species of bird (e.g. hen or duck eggs need to be distinguishable). When soil sampling works are in progress in the garden birds should be kept locked away where possible, if not possible they should be kept away from the digging and sampling areas.
Egg Sampling Procedures	Upon receipt of the eggs from the poultry keeper the site personnel will wrap each individual egg in a PFAS free bag (compostable waste bags can be used) and then the eggs are to be placed in PFAS free cardboard egg boxes. Between 1 and 4 eggs of the same species are

METHOD STATEMENT – Collection of Eggs

<u>Sample Container and Packaging Constraints</u>	required to make up 1 sample. The egg box should then be appropriately labelled with sampling nomenclature and the species of egg within each sample recorded. Clean powder-free nitrile gloves to be worn when handling eggs. The PFAS free bag and egg boxes should be rinsate tested in order to determine if any traces PFAS are detectable.						
<u>Egg Sampling Procedures Sample Shipping</u>	Once individual samples are secured in egg boxes and labelled the egg boxes should be placed in a cardboard box for shipping surrounded by shredded cardboard packaging to reduce the likelihood of breakage during shipping. The shipping box should be well sealed and labelled as fragile. The eggs should then be sent to an appropriate testing laboratory (e.g Eurofins Food Testing UK Limited) and confirmation of receipt should be provided. Where multiple eggs (of the same species) make up a sample, these will be combined on receipt and prior to testing by the performing laboratory.						
<u>Egg Sampling Procedures Field equipment and personnel decontamination</u>	To reduce the risk of site personnel contracting a disease from handling eggs or working within an area that the birds clean powder-free nitrile gloves should be worn when handling eggs, soil or anything the birds may have come into contact with. Hands and arms should be thoroughly washed to mitigate the transmission of germs. If the coop area appears dry, dampen the soil (with PFAS free water) prior to entering and breaking ground to reduce the likelihood of dust generation. If required to enter a confined or poorly ventilated poultry enclosure consider wearing a PFF3 dust mask. To reduce the risk of transmission of avian diseases between properties soil should be removed from boots and equipment prior to leaving the property, equipment and boots should be sprayed with Virkon S disinfectant and left to dry before it is rinsed off with PFAS free deionised water. Virkon S should be managed with care; stored in a sealed container in a cool dry place, gloves should be worn when mixing a solution, when spraying boots keep the spray bottle close to the boots and ground and personnel should be located up wind. A property should not be visited if they report a suspicion of any contagious avian diseases being present within their livestock.						
Required Personnel Protective Equipment:	 Safety Boots	 Hard Hats	 Safety Gloves	 Hearing Protection	 Eye Protection	 Respiratory Protection	Other: 1. Hi-visibility waistcoat/ jacket/ coat* 2. PFAS free disposable Gloves* 3. Weather dependent PPE e.g. waterproofs* or sunscreen* (use to be documented in site diary with the refined sampling protocols to be adopted)

METHOD STATEMENT – Excavation of Hand Pits

Project Name:	Land at Thornton-Cleveleys	Project Number:	70100310
This document is to be read in conjunction with	• T480 – Site Risk Assessment for the works. • Construction Phase Plan. • Site Documents Pack (including contractor Risk Assessments and Method Statements (if applicable), COSHH assessments, proposed exploratory hole plan and exploratory hole and sampling schedule). • Permit(s) to Dig		
Purpose	This Method Statement has been written for the excavation of hand dug pits as part of ground investigations. It does not cover temporary propping or shoring of pits. It does not cover utility avoidance surveys – see Procedure for the avoidance of underground utilities and below ground structures: here.		
Equipment:	• Hand digging tools (Insulated shovel, scissor shovels, etc.). • Tablet (or other method for taking logs and notes including stationery)/ weather writer* clipboard or somewhere to store drawings and paperwork. • Pens* / pencils. • Tape measure. • Camera (separate to phone or tablet if necessary). • Laboratory supplied sample containers* and chain of custody sheets (if obtaining samples). • Sampling trowel (stainless steel*). • PID (if head space testing and/or personal monitoring require one). • Spill kit (may be provided by Contractor). • Blue roll. • Heavy plastic sheeting* or boards for soil arisings (if required and if not provided by Contractor). • Detergent / PFAS free decontamination solution* (if required, COSHH assessment to be in Site Documents Pack). • PFAS free deionised water for rinsing equipment. • PFAS free buckets and wastewater storage container for decontamination. • Photo board* (if required). • Pedestrian barriers and hazard tape (if required and if not provided by Contractor) • Permits to Dig for the hand dug pit locations. • CAT and Genny Minimum CAT4+ or equivalent (if not provided by Contractor). • Hand held GPS.		
Site specific requirements	OTHER SITE-SPECIFIC REQUIREMENTS: • Known constraints: Specific to each land parcel and to be assessed as part of a dynamic risk assessment e.g. soft / uneven ground, structures, trench / manhole covers, overhead wires / gantries, rabbit burrow, etc. • Pedestrian barrier requirements around each work location to segregate hand pit works and public/other works: Mobile/folding pedestrian barriers to be placed around hand pitting equipment and hand pit within land parcels that are open to the public. Not required for private/secure land parcels. • Personal / ambient monitoring requirements: No personal or ambient monitoring requirements • Target depth for hand pits: 600mm (unless specifically indicated otherwise based on known tillage or ground disturbance). See exploratory hole and sampling schedule. • Soil sampling requirements: See exploratory hole and sampling schedule for specific location requirements. Generic requirements: - o Surface or near-surface soil (primarily 0.0- 0.05m) - o Sub-surface soil (0.10 – 0.15m)		

METHOD STATEMENT – Excavation of Hand Pits

	- o Deeper soil (0.4 - 0.6m) - o Change in strata to also trigger sample collection • In-situ testing requirements: No in-situ testing required • Chemical laboratory details: - o Samples to be couriered under chain of custody procedures to ALS Lif Sciences Ltd, Hawarden Business Park, Hawarden. CH5 3US. Tel: 01244528700 Email: Hawarden.sales@alsglobal.com - o Samples to be packaged and transported in cooled box/bag provided by the laboratory - o All soil samples collected to be scheduled for PFAS Broad Suite (TM440) in accordance with the exploratory hole and sampling schedule. Note some samples may be selected for interim storage at the laboratory and later scheduling. • Disposal of arisings: During the works, all arisings retrieved are to be stored on sheeting or boards in the order retrieved. Once target depth has been achieved and required samples collected, the arisings are to be replaced within the hole consistent with the order they were obtained. Any deficit (due to sampling) to be made up from a local surface scrape, where feasible. The replaced material should be compacted during backfill and left slightly mounded to allow for settlement. • Decontamination of equipment: Tools to be decontaminated using PFAS free detergent prior to commencement and prior to sample collection. After decontamination a final rinse should be undertaken using laboratory supplied PFAS free deionised water. • QA/QC: equipment/rinsate samples to be collected in accordance with the exploratory hole and sampling schedule.
PFAS specific requirements	<i>*PFAS SPECIFIC CONSIDERATIONS: Items within the method statement marked with an asterix (*) indicates where consideration should be given to the potential for the influence of positive and negative sample bias¹ relating to PFAS. Note, research indicates that the most likely pathway for sample bias is through direct contact between sampling equipment and the sample. Examples are provided below.</i> • Equipment: - o Weather writers, waterproof paper and other equipment comprised of waterproof materials should only be used in inclement weather. Such items should be kept separate from sampling equipment and gloves changed between use of equipment and interaction with the samples. - o Use of waterproof pens including permanent markers and dry wipe markers should be avoided. - o Sample containers should be supplied by the laboratory and specifically for PFAS analysis (Only use high-density polyethylene (HDPE) or polypropylene containers with unlined plastic caps). - o Tools used for digging and sampling should be PFAS free. - o Any plastic sheeting or boards to be used for storing spoil should be PFAS free. - o Decontamination detergents or solutions should be PFAS free and supplied by the laboratory e.g. liquinox. Laboratory supplied PFAS free deionised water should be used for the final rinse during decontamination of sampling equipment. • PPE: Consideration in the use and selection of PPE should also be given to the potential for the introduction of PFAS into the sampling process e.g.

¹ Positive bias is the overestimation of analyte concentration and can result from contamination of samples by field equipment, materials, and sampling procedures used during sample collection, storage, and transport. Negative bias is the underestimation of analyte concentration and can result from improper field sampling procedures, using materials to which the contaminant sorbs, or sample storage conditions that could result in analyte degradation prior to analysis. (NGWA, 2023)

METHOD STATEMENT – Excavation of Hand Pits

	- o Waterproof fabrics can contain PFAS and should only be worn in inclement weather. If worn, all precautions should be taken to avoid contact between the sample and the waterproof fabric. E.g. Sample container should not be stored or transported in coat pockets. Recommended material for field clothing and PPE may include waterproof clothing that contains polyurethane, polyvinyl chloride, wax-coated fabric, rubber, or neoprene. The use of waterproof clothing during sample collection should be documented in the site diary with the refined sampling protocols to be adopted. - o Disposable powder-free nitrile gloves to be changed frequently. Hands should be washed with PFAS-free soap and new, clean disposable gloves should be donned prior to the collection of each sample. - o Application of sunscreen or insect repellents to be undertaken outside of the working area and hands thoroughly washed with PFAS free soap prior to re-entry. Use should be documented in the site diary with the refined sampling protocols to be adopted. • Food and cosmetic products: General consideration to be given to the potential for introduction of PFAS into the sampling process e.g. - o Food products and packaging can contain PFAS. Food should be consumed outside of the working area and packaging disposed of appropriately. Hands to be washed thoroughly with PFAS free soap after consumption or handling of food or food packaging. - o Fabric detergents and cosmetics can contain PFAS. Contact between skin or clothing and the sample should be avoided. - o Disposable powder-free nitrile gloves to be changed frequently. • Disposable powder-free nitrile gloves must be worn at all times and a new pair of nitrile gloves are to be worn prior to the following activities at each sample location: - o Contact with laboratory-supplied sample containers or PFAS-free water containers. - o Decontamination of sampling equipment. - o Sample collection. - o Handling of QA/QC samples including field blanks and equipment blanks. - o After the handling of any non-dedicated sampling equipment or contact with non-decontaminated surfaces.
Detailed Methodology of works to be carried out: <u>Prior to Mobilising to hand pit locations.</u>	• All personnel should wear PPE* as stated in the site-specific instructions/Risk Assessment. • COSHH assessments for all materials used on site should be available. • All staff are to be briefed as to their responsibilities and aware of the safety measures in place during the works. • Hand tools should be insulated. WSP engineers should inspect hand tools for damage and suitability prior to using the tools. Any damaged hand tools are to be disposed of safely and new tools must be purchased.
Equipment decontamination procedure	Equipment decontamination: • Rinse equipment thoroughly with an Alconox®, Citranox® or Liquinox® solution made with laboratory-supplied PFAS-free deionized water. • Triple rinse with laboratory-supplied PFAS-free water. • If elevated concentrations of other organic contaminants are present, wipe the equipment with solvent followed by rinses with detergent and laboratory-supplied PFAS-free water as above; solvent type is to be selected based on local protocols and standards, and could include isopropyl alcohol, methylated spirits (denatured alcohol),

METHOD STATEMENT – Excavation of Hand Pits

	methyl hydrate (methanol) or acetone. Review SDS prior to use of solvent and avoid use of solvent that is a contaminant of concern at the site. • Allow equipment to air dry. • When suitable, store equipment in a clean Ziploc® bag until required. • Decontamination fluids are not to be reused during the sampling program and should be collected in a waste container for proper disposal as per local regulations.
Detailed Methodology of works to be carried out: <u>Establishing work area at hand pit locations</u>	1. Hand pits will be progressed at the locations shown on the exploratory hole location plan and within the utility clearance area that is covered by a permit to dig. 2. Check buried utilities and clearance boxes are clearly marked. If the utility spray paint markings are no longer visible, contact the project manager. 3. Check the work area is safe before setting up. Known constraints/obstructions including ecological ones will be highlighted in the site-specific instructions. 4. Pre-condition photos should be taken before the work area is set up. 5. Pit locations to be recorded using handheld GPS. 6. The work area should be large enough to ensure that there is room for the required equipment, operatives, and spoil and that the investigation team are able to move around freely to minimise the risk of slips, trip and falls. Ensure that good housekeeping takes place including ensuring that trip hazards such as cool boxes, dip tapes and sample containers are stored in a safe place. 7. Set-up pedestrian barriers to segregate work area as required in the site-specific instruction. 8. Set-up personal monitoring if/as required in the site-specific instruction. 9. WSP supervisor/engineer to ensure spill kit, fire extinguisher and first aid kit/ eye wash are available close to the location.
Detailed Methodology of works to be carried out: <u>Hand Pit Excavation</u>	• In-ground excavations are hazardous and can be fatal if not undertaken correctly. Under no circumstances should any WSP employees or sub-contractor enter an excavation, regardless of depth. • Before excavation commences, the supervising WSP engineer will scan the surface of the hand pit with a CAT 4 and signal generator to confirm the absence of services. (Check utility clearance equipment has a valid calibration). • WSP Engineer to issue Permit to Dig. • Knee pads or a kneel pad must be used by the WSP engineer to avoid contact with sharps on the ground when kneeling down. Avoid kneeling if possible. • Plastic sheeting* or bulk bags* will be placed at ground level ready for arisings. Locate soil arisings away from pit edge and samples to be taken from the arisings pile. Segregate arisings based on soil type. • Keep surface dressing material or turf etc. stored separately to avoid mixing with other arisings so that this can be replaced when backfilling and compaction has been completed • Safe digging techniques are to be utilised during excavation works, this includes the use of only insulated spades, shovels and grafts, the use of picks, bars or pinch bars is prohibited. Excessive force should not be used to undertake the excavation and the digging tools should not be thrown into the pit. • Pits will be excavated by the WSP engineer to the required depth as stated in the site-specific requirements. Contact the PM if this is not possible. Hand pits should be terminated, and the PM contacted if any of the following occur to consider whether it is safe to continue: • Visibility is impaired by rapid ingress of water; water should be monitored to ensure this stabilises. • Signs of utilities in the excavation such as clean fill material (pea gravel or sand), marker tape, marker tiles or cables/pipework.

METHOD STATEMENT – Excavation of Hand Pits

	• Visual observation of quantities of suspected asbestos containing materials (ACM) such as lagging or cement bonded asbestos. • Soil arisings should be logged in accordance with BS5930:2015+A1:2020. Where waste materials are encountered these should be logged as close to the guidance documents with detail provided on the type of materials, any dates and percentage composition. • Descriptions of visual and olfactory contamination should accord with the scale provided in the table below. • Soil sampling and in-situ testing to be undertaken as the excavation progresses based on details provided in the site-specific requirement. Soils for chemical sampling to be kept in cool box with real ice, double bagged with LDPE bags (avoid use of chemical freezer packs). Visual and Olfactory Contamination Descriptions <table border="1"> <thead> <tr> <th>Visual Evidence of Contamination</th><th>Olfactory Evidence of Contamination</th></tr> </thead> <tbody> <tr> <td>1 – No obvious contamination</td><td>A – No perceived odour</td></tr> <tr> <td>2 – Slight evidence of contamination</td><td>B – Slight odour</td></tr> <tr> <td>3 – Definite evidence of contamination</td><td>C – Definite odour</td></tr> <tr> <td>4 – Gross contamination (free product)</td><td>D – Strong odour</td></tr> </tbody> </table> If you are unsure about anything, contact the PM and/or Site Manager. If you have any concerns regarding the safety of the work, YOU ARE AUTHORISED TO STOP THE WORK and you have a duty to intervene – you can have confidence that you will always be supported by WSP if you intervene on safety grounds.	Visual Evidence of Contamination	Olfactory Evidence of Contamination	1 – No obvious contamination	A – No perceived odour	2 – Slight evidence of contamination	B – Slight odour	3 – Definite evidence of contamination	C – Definite odour	4 – Gross contamination (free product)	D – Strong odour
Visual Evidence of Contamination	Olfactory Evidence of Contamination										
1 – No obvious contamination	A – No perceived odour										
2 – Slight evidence of contamination	B – Slight odour										
3 – Definite evidence of contamination	C – Definite odour										
4 – Gross contamination (free product)	D – Strong odour										
Detailed Methodology of works to be carried out: <u>Sample Handling</u>	• Samples should be collected in laboratory supplied sample containers, packaged and immediately placed on ice within the laboratory supplied coolboxes/bags. • Samples to be shipped as soon as possible (within 24hrs) to the laboratory using the laboratory arranged courier under chain of custody procedures. • Samples should remain cool during storage and shipment ($\leq 6^{\circ}\text{C}$). Therefore, if samples are stored for an extended period of time, ice may need to be replaced. • Samples should be scheduled for the required analysis within the required timeframe to ensure the relevant holding times are not exceeded. • Coolers must be packed in such a way as to ensure that no leaks occur during shipment and storage. Ice must be double bagged to prevent leaks. Ice bags should be placed in such a way as to ensure good contact between the ice bags and the sample containers, preferably in the upper part of the cooler since warm air tends to stay higher. Organize the containers in the cooler appropriately and add bubble wrap as needed. • Samples from different land parcels should be segregated so that each coolbox/bag only contains samples from a single land parcel.										
Detailed Methodology of works to be carried out: <u>Hand Pit Backfilling</u>	DO NOT LEAVE OPEN EXCAVATIONS UNATTENDED 1. Excavation to be backfilled using the soil arisings. 2. Arisings to be replaced in reverse order and compacted in layers using hand tools. 3. Obtain a photograph of the reinstated hand pit and work area. 4. WSP Engineer to complete and close the Permit to Dig. In areas accessible to the public, all hand pits to be fenced with pedestrian barriers to prevent unauthorised access to work area. No open hand pit to be left open and unfenced or unattended. NB the hand pits are unlikely to exceed 0.3m diameter and 0.6m depth and										

METHOD STATEMENT – Excavation of Hand Pits

	therefore only represent a potential trip hazard rather than an unstable excavation or fall from height.						
Required Personnel Protective Equipment:	 Safety Boots	 Hard Hats	 Safety Gloves	 Hearing Protection	 Eye Protection	 Respiratory Protection	Other: 1. Hi-visibility waistcoat/ jacket/ coat* 2. Knee pads 3. PFAS free disposable Gloves* 4. Weather dependent PPE e.g. waterproofs* or sunscreen* (use to be documented in site diary with the refined sampling protocols to be adopted)
Applicable:	Yes Conform to 20345:2011 and protective mid-sole	Yes Conforms to EN397	Yes Cut resistant level 3 EN388	No	Yes Splash and impact resistant with sides EN166	No

METHOD STATEMENT – Supervision of GPR Survey

Project Name:	Thornton preliminary offsite sampling	Project Number:	70100310				
This document is to be read in conjunction with	- T480 – Site Risk Assessment for the works - Construction Phase Plan - Site Documents Pack (including Risk Assessment and Method Statement provided by the Contractor, COSHH assessments, exploratory hole plan). - GPRS Risk Assessment						
Purpose	This Method Statement has been written for the supervision of GPR Survey as part of a wider ground investigation. The WSP procedure for the avoidance of underground utilities and below ground structures is available here.						
Equipment:	- Tablet (or other method for taking logs and notes including stationery)/ Weather writer clipboard or somewhere to store drawings and paperwork. - Camera (separate to phone or tablet if necessary).						
Site specific requirements	- Known constraints: uneven ground surfaces and vegetation - Pedestrian barrier requirements around each work location to segregate works and public/other works: pedestrian barriers placed around survey area in areas accessible to the general public.						
Detailed Methodology of works to be carried out: Prior to Mobilising to clearance locations.	- All staff should wear PPE as stated in the Site-specific instructions/Risk Assessment. - Check any aerosol paints proposed to be used by the contractor for demarcating cleared areas are PFAS free. - Supervision of works to instruct contractor on locations to be cleared, ensure methodology is followed, and address any public interactions.						
Detailed Methodology of works to be carried out: Establishing work area and conducting survey	- Utility clearance to be undertaken at the locations shown on the exploratory hole location plan. Inform the Contractor of the area(s) required to be cleared. - Check the work area is safe before proceeding. - Ensure that good housekeeping takes place including ensuring that trip hazards are minimised (e.g. equipment stored in a safe place). - Set-up barriers if/as required in Site-specific instructions. If you are unsure about anything, contact the PM and/or Site Manager. If you have any concerns regarding the safety of the work, YOU ARE AUTHORISED TO STOP THE WORK and you have a duty to intervene – you can have confidence that you will always be supported by Wood if you intervene on safety grounds.						
Required Personnel Protective Equipment:	 Safety Boots	 Hard Hats	 Safety Gloves	 Hearing Protection	 Eye Protection	 Respiratory Protection	Other:
Applicable:	Yes Conform to 20345:2011 and protective mid-sole	Yes Conforms to EN397	Yes Cut resistant level 3 EN388	No	No	No	1. Hi-visibility waistcoat/ jacket/ coat

CERTIFICATE OF ANALYSIS

Date of report Generation:	22 October 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251009-16
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	781068
Order Number:	UK-70100310-403

We received 29 samples on Wednesday October 08, 2025 and 27 of these samples were scheduled for analysis which was completed on Wednesday October 22, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Approved By:

Justin Keeton
Business Unit Leader - Land

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 24 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251009-16
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781238
Order Number: UK-70100310-403

This report has been revised and directly supersedes 781068 in its entirety.

We received 29 samples on Wednesday October 08, 2025 and 27 of these samples were scheduled for analysis which was completed on Wednesday October 22, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Approved By:

Justin Keeton

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251009-16
Client Ref: UK-70100310

Report Number: 781238
Location: Thornton Phase 3

Superseded Report: 781068

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	22 October 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251010-37
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	781069
Order Number:	UK-70100310

We received 31 samples on Thursday October 09, 2025 and 29 of these samples were scheduled for analysis which was completed on Wednesday October 22, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Client Ref.: UK-70100310

Location: Thornton Phase 3

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 23 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251010-37
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781122
Order Number: UK-70100310

This report has been revised and directly supersedes 781111 in its entirety.

We received 31 samples on Thursday October 09, 2025 and 29 of these samples were scheduled for analysis which was completed on Wednesday October 22, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Total Organic Carbon	TM132	96.29 93.61 : 106.00	97.67 93.61 : 106.00	94.82 93.61 : 106.00	96.2 93.61 : 106.00	97.46 93.61 : 106.00

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251010-37
Client Ref: UK-70100310

Report Number: 781122
Location: Thornton Phase 3

Superseded Report: 781111

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 24 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251011-63
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781218
Order Number: UK-70100310-403

This report has been revised and directly supersedes 780941 in its entirety.

We received 35 samples on Saturday October 11, 2025 and 34 of these samples were scheduled for analysis which was completed on Friday October 24, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251011-63 Report Number: 781218 Superseded Report: 780941
Client Ref.: UK-70100310 Location: Thornton Phase 3

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251011-63
Client Ref: UK-70100310

Report Number: 781218
Location: Thornton Phase 3

Superseded Report: 780941

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 23 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251011-64
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781205
Order Number: UK-70100310-403

This report has been revised and directly supersedes 780935 in its entirety.

We received 23 samples on Saturday October 11, 2025 and 20 of these samples were scheduled for analysis which was completed on Thursday October 23, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Approved By:

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

Superseded Report: 780935

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 29 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251016-26
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781575
Order Number: UK-70100310-403

This report has been revised and directly supersedes 781332 in its entirety.

We received 27 samples on Tuesday October 14, 2025 and 25 of these samples were scheduled for analysis which was completed on Wednesday October 29, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251016-26
Client Ref: UK-70100310

Report Number: 781575
Location: Thornton Phase 3

Superseded Report: 781332

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 29 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251016-37
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781594
Order Number: UK-70100310-403

This report has been revised and directly supersedes 781331 in its entirety.

We received 26 samples on Thursday October 16, 2025 and 26 of these samples were scheduled for analysis which was completed on Wednesday October 29, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Table of Results - Appendix

Method No	Description
TM434	Analysis of PFAS
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251016-37
Client Ref: UK-70100310

Report Number: 781594
Location: Thornton Phase 3

Superseded Report: 781331

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 30 October 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251016-65
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 781754
Order Number: UK-70100310-403

This report has been revised and directly supersedes 781595 in its entirety.

We received 26 samples on Wednesday October 15, 2025 and 16 of these samples were scheduled for analysis which was completed on Wednesday October 29, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

Client Ref: UK-70100310

Report Number: 781754
Location: Thornton Phase 3

Superseded Report: 781595

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	29 October 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251018-46
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	781597
Order Number:	UK-70100310-403

We received 19 samples on Friday October 17, 2025 and 19 of these samples were scheduled for analysis which was completed on Wednesday October 29, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

32311310	GR04-SP411-E	0.50 - 0.60	Dark Brown	Clay Loam	Vegetation	None

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung. Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	29 October 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251018-47
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	781596
Order Number:	UK-70100310-403

We received 32 samples on Friday October 17, 2025 and 32 of these samples were scheduled for analysis which was completed on Wednesday October 29, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251018-47
Client Ref: UK-70100310

Report Number: 781596
Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	29 October 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251018-49
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	781598
Order Number:	UK-70100310-403

We received 27 samples on Friday October 17, 2025 and 27 of these samples were scheduled for analysis which was completed on Wednesday October 29, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	04 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251023-65
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	782044
Order Number:	UK-70100310

We received 47 samples on Thursday October 23, 2025 and 47 of these samples were scheduled for analysis which was completed on Tuesday November 04, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Location: Thornton Phase 3

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	
TM434	Analysis of PFAS

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

Report No:	782348
Order Number:	UK-70100310-403

We received 34 samples on Wednesday October 22, 2025 and 34 of these samples were scheduled for analysis which was completed on Thursday November 06, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung. Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	06 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251024-36
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	782396
Order Number:	UK-70100310

We received 52 samples on Friday October 24, 2025 and 52 of these samples were scheduled for analysis which was completed on Thursday November 06, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251024-36

Report Number: 782396

Superseded Report:

Client Ref.: UK-70100310

Location: Thornton Phase 3

Table of Results - Appendix

Method No	Description
TM434	Analysis of PFAS
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 11 November 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251028-21
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 782785
Order Number: UK-70100310

This report has been revised and directly supersedes 782385 in its entirety.

We received 52 samples on Tuesday October 28, 2025 and 53 of these samples were scheduled for analysis which was completed on Tuesday November 11, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Approved By:

Justin Keeton

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS
TM440	

NA = not applicable.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	06 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251028-34
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	782337
Order Number:	UK-70100310

We received 52 samples on Saturday October 25, 2025 and 51 of these samples were scheduled for analysis which was completed on Thursday November 06, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251028-34 Report Number: 782337 Superseded Report:
Client Ref.: UK-70100310 Location: Thornton Phase 3

Table of Results - Appendix

Method No	Description
TM434	Analysis of PFAS
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 12 November 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251029-28
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 782959
Order Number: UK-70100310

This report has been revised and directly supersedes 782329 in its entirety.

We received 47 samples on Wednesday October 29, 2025 and 46 of these samples were scheduled for analysis which was completed on Wednesday November 12, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

			Colour	Description	Inclusions	Inclusions 2
32361347	GR03-SP325-G	0.00 - 0.10	Dark Brown	Silt Loam	Stones	Vegetation
32361349	GR03-SP325-G	0.30 - 0.40	Light Brown	Sandy Silt Loam	Stones	Vegetation
32361351	GR03-SP325-G	0.40 - 0.50	Light Brown	Sandy Clay Loam	Stones	Vegetation

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Table of Results - Appendix

Method No	Description
TM434	Analysis of PFAS
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

Total Organic Carbon	TM132	98.16 93.61 : 106.00

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251029-28
Client Ref: UK-70100310

Report Number: 782959
Location: Thornton Phase 3

Superseded Report: 782329

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	14 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251031-20
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	783169
Order Number:	UK-70100310

We received 46 samples on Friday October 31, 2025 and 46 of these samples were scheduled for analysis which was completed on Friday November 14, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251031-20
Client Ref: UK-70100310

Report Number: 783169
Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	14 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251031-21
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	783170
Order Number:	UK-70100310

We received 39 samples on Friday October 31, 2025 and 39 of these samples were scheduled for analysis which was completed on Friday November 14, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Report Number: 783170
Location: Thornton Phase 3

Superseded Report:

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	17 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251101-67
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	783298
Order Number:	UK-70100310

We received 39 samples on Saturday November 01, 2025 and 39 of these samples were scheduled for analysis which was completed on Monday November 17, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251101-67
Client Ref.: UK-70100310

Report Number: 783298
Location: Thornton Phase 3

Superseded Report:

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Total Organic Carbon	TM132	97.61 93.61 : 106.00	96.69 93.61 : 106.00	97.82 93.61 : 106.00	96.11 93.61 : 106.00

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251101-67
Client Ref: UK-70100310

Report Number: 783298
Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung. Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	14 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251103-17
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	783171
Order Number:	UK-70100310

We received 47 samples on Saturday November 01, 2025 and 46 of these samples were scheduled for analysis which was completed on Friday November 14, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS
TM440	

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251103-17
Client Ref: UK-70100310

Report Number: 783171
Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	26 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251107-27
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	784114
Order Number:	UK-70100310

We received 30 samples on Tuesday November 04, 2025 and 30 of these samples were scheduled for analysis which was completed on Wednesday November 26, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 26 November 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251107-28
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 784119
Order Number: UK-70100310

This report has been revised and directly supersedes 783513 in its entirety.

We received 29 samples on Thursday November 06, 2025 and 29 of these samples were scheduled for analysis which was completed on Wednesday November 26, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 26 November 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251107-41
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 784125
Order Number: UK-70100310

This report has been revised and directly supersedes 783955 in its entirety.

We received 35 samples on Friday November 07, 2025 and 35 of these samples were scheduled for analysis which was completed on Wednesday November 26, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251107-41
Client Ref.: UK-70100310

Report Number: 784125
Location: Thornton Phase 3

Superseded Report: 783955

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.
