5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	26 November 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251107-42
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	784121
Order Number:	UK-70100310

We received 51 samples on Friday November 07, 2025 and 51 of these samples were scheduled for analysis which was completed on Wednesday November 26, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Client Ref: UK-70100310

Report Number: 784121
Location: Thornton Phase 3

Superseded Report:

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung. Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 27 November 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251110-24
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 784214
Order Number: UK-70100310

This report has been revised and directly supersedes 784031 in its entirety.

We received 5 samples on Friday November 07, 2025 and 5 of these samples were scheduled for analysis which was completed on Thursday November 27, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

Approved By:

Justin Keeton
Business Unit Leader - Land

CERTIFICATE OF ANALYSIS

Validated

SDG: 251110-24
Client Ref.: UK-70100310

Report Number: 784214
Location: Thornton Phase 3

Superseded Report: 784031

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	Analysis of PFAS in Solid matrices
TM434	Analysis of PFAS in Liquid matrices

NA = not applicable.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

Superseded Report: 784031

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 03 December 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251110-25
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 784761
Order Number: UK-70100310

This report has been revised and directly supersedes 784127 in its entirety.

We received 47 samples on Saturday November 08, 2025 and 45 of these samples were scheduled for analysis which was completed on Wednesday December 03, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 03 December 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251112-63
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 784762
Order Number: UK-70100310

This report has been revised and directly supersedes 783511 in its entirety.

We received 46 samples on Wednesday November 12, 2025 and 46 of these samples were scheduled for analysis which was completed on Wednesday December 03, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Report Number: 784762
Location: Thornton Phase 3

Superseded Report: 783511

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS in Liquid matrices
TM440	Analysis of PFAS in Solid matrices

NA = not applicable.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	03 December 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251114-62
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	784698
Order Number:	UK-70100310

We received 47 samples on Thursday November 13, 2025 and 47 of these samples were scheduled for analysis which was completed on Tuesday December 02, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Location: Thornton Phase 3

Table of Results - Appendix

Method No	Description
TM434	Analysis of PFAS in Liquid matrices
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM440	Analysis of PFAS in Solid matrices

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	03 December 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251115-42
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	784798
Order Number:	UK-70100310

We received 50 samples on Friday November 14, 2025 and 50 of these samples were scheduled for analysis which was completed on Wednesday December 03, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	11 December 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251119-14
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	785595
Order Number:	UK-70100310

We received 33 samples on Tuesday November 18, 2025 and 33 of these samples were scheduled for analysis which was completed on Thursday December 11, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 11 December 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251119-15
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 785596
Order Number: UK-70100310

This report has been revised and directly supersedes 783952 in its entirety.

We received 57 samples on Wednesday November 19, 2025 and 56 of these samples were scheduled for analysis which was completed on Thursday December 11, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS in Liquid matrices
TM440	Analysis of PFAS in Solid matrices

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251119-15
Client Ref: UK-70100310

Report Number: 785596
Location: Thornton Phase 3

Superseded Report: 783952

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis.

The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation: 18 December 2025
Customer: WSP UK Limited
Sample Delivery Group (SDG): 251121-24
Your Reference: UK-70100310
Location: Thornton Phase 3
Report No: 786518
Order Number: UK-70100310

This report has been revised and directly supersedes 784597 in its entirety.

We received 39 samples on Friday November 21, 2025 and 39 of these samples were scheduled for analysis which was completed on Thursday December 18, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251121-24
Client Ref.: UK-70100310

Report Number: 786518
Location: Thornton Phase 3

Superseded Report: 784597

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

CERTIFICATE OF ANALYSIS

Validated

SDG: 251121-24
Client Ref.: UK-70100310

Report Number: 786518
Location: Thornton Phase 3

Superseded Report: 784597

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS in Liquid matrices
TM440	Analysis of PFAS in Solid matrices

NA = not applicable.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

SDG: 251121-24
Client Ref: UK-70100310

Report Number: 786518
Location: Thornton Phase 3

Superseded Report: 784597

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

CERTIFICATE OF ANALYSIS

Date of report Generation:	18 December 2025
Customer:	WSP UK Limited
Sample Delivery Group (SDG):	251122-24
Your Reference:	UK-70100310
Location:	Thornton Phase 3
Report No:	786519
Order Number:	UK-70100310

This report has been revised and directly supersedes 784694 in its entirety.

We received 57 samples on Saturday November 22, 2025 and 57 of these samples were scheduled for analysis which was completed on Thursday December 18, 2025. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Table of Results - Appendix

Method No	Description
PM024	Soil preparation including homogenisation, moisture, screens of soils for Asbestos Containing Material
TM132	ELTRA CS800 Operators Guide
TM133	Determination of pH in Soil and Water using the GLpH pH Meter
TM434	Analysis of PFAS in Liquid matrices
TM440	Analysis of PFAS in Solid matrices

NA = not applicable.
Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden (Method codes TM).

The above information details the reference name of the analytical quality control sample (AQC) that has been run with the samples contained in this report for the different methods of analysis.

The figure detailed is the percentage recovery result for the AQC.

The subscript numbers below are the percentage recovery lower control limit (LCL) and the upper control limit (UCL). The percentage recovery result for the AQC should be between these limits to be statistically in control.

CERTIFICATE OF ANALYSIS

Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH₄ by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur - e.g volatile mercury.

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

1	Container with Headspace provided for volatiles analysis
2	Incorrect container received
3	Deviation from method
4	Matrix interference
♦	Sample holding time exceeded in laboratory
@	Sample holding time exceeded due to late arrival of instructions or samples
§	Sampled on date not provided

20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

If during the search of the two 'pinch' samples by PLM only 1 or 2 fibres or fibre bundles are seen and identified as asbestos, the term 'trace asbestos identified' is reported.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Potentially respirable fibres are identified by using a Phase Contrast Microscope.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

21. 6:2 FTAB

Recovery of 6:2 FTAB in the quality control samples has been observed to be <50% of the target value. Please note the 6:2 FTAB result is supplied as indicative only.

ArubaPEC S.p.A., IT

follow test report No. RP-ENV-26/000008991

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

follow test report No. RP-ENV-26/000008992

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor $k=2$ corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor $k=2$ corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor $k=2$ corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

follow test report No. RP-ENV-26/000009005

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. follow test report No. RP-ENV-26/000008977

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor $k=2$ corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor $k=2$ corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

follow test report No. RP-ENV-26/000008952

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

follow test report No. RP-ENV-26/000008930

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

follow test report No. RP-ENV-26/000008939

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

follow test report No. RP-ENV-26/000008875

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor k=2 corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor k =2 corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor k=2 corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor $k=2$ corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor $k=2$ corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor $k=2$ corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

ArubaPEC S.p.A., IT

follow test report No. RP-ENV-26/000008989

MDL=LOD: Method Detection Limit, defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. RL=LOQ: Limit of quantification, defined as the concentration of the lowest point of the calibration curve, corrected by the scale factor (weight; dilution) indicated by the applied procedure or rule. "<x" or ">x" represent a value below or above the test measuring range, respectively. Due to the influence of matrix and contaminants present, the sample portion under analysis may have required dilution with a consequent increase in the MDL (detection limit) or RL (limit of quantification) value, in order to comply with the quality criteria of the test methods. The value of < MDL or < RL obtained in this way, although higher than the specification limit, is not indicative of the exceeding of the limit itself. The determination may therefore not be detectable with the required sensitivity. Unless otherwise specified, calculations are performed according to the lower bound (L.B.) criterion. Therefore, if all parameters contributing to the calculation are below their respective RL/MDL, the result will be expressed as "<x", where x is the highest RL/MDL among the analytes involved in the calculation. In case of alteration of the sample, if the customer requests perform the analysis anyway, the laboratory declines any responsibility on those results that can be affected by the deviation. The results expressed in concentration are related to the sampled volume. In the case of sampling performed by a Chelab technician on a water matrix, the UNI EN ISO 5667-1 standard regarding the definition of sampling plans and sampling techniques and the UNI EN ISO 5667-3 standard regarding sample storage, handling and transport are applied. If the sampling is not carried out by the laboratory staff, the results obtained are considered referring to the sample as received and the laboratory declines its responsibility for the results calculated considering the sampling data provided by the Customer. The name and contact information of the Customer are always provided by the Customer. If not otherwise specified, the uncertainty is expanded and has been calculated with a coverage factor $k=2$ corresponding to a probability interval of about 95% or as a confidence interval calculated with a probability level of about 95%. For parameters whose extended uncertainty is greater than the result, since it is not possible to express a negative concentration, the final result is expressed in square brackets, which mean that the true value is between zero, which is excluded, and the sum of the result with its extended uncertainty. Parameters prefixed with "-" are calculated. The values between MDL and RL are estimated with a 99% confidence level. The associated measurement uncertainty is estimated using the same percentage applied for RL. The line marked by a star (*) is not accredited by Accredia, member of MLA, for the operating unit or laboratory that performed it.

R% is the recovery, recoveries marked by an hashtag (#) have not been used in the calculations. The recovery relates to the analytical phases performed in the laboratory. If there is a specification (law limits, customer specifications) which has been compared to the analytical results, the values shown in bold indicate a result which is out of the specification. If not differently specified the judgments of compliance /non-compliance eventually reported are referred to analyzed parameters and are based on the comparison of the value with the reference values without considering the confidence interval of measure or the uncertainty of the result. In this case, the risk that accepted items are outside the tolerance limit is up to 50%. The risk of false reject is up to 50% for measured results outside the tolerance (this is called simple acceptance or "shared risk"). The estimate of the measurand is assumed to have a normal probability distribution. If not differently specified, the quantitative microbiological tests (excluded MPN) are performed on liquid and solid environmental matrices on single repetition and two consecutive dilutions; the expanded uncertainty of the result is expressed in accordance to ISO 29201:2012, calculated with a coverage factor $k=2$ corresponding to a probability level of 95%; in case of methods reporting the result as MPN (Most Probable Number), the uncertainty of the result is expressed as the fiducial interval estimated using the statistical tables of the reference method and is calculated with a coverage factor $k=2$ corresponding to a probability level of 95%.

Categories: Cat. 0: Tests performed at the laboratory. Cat. I: Tests performed at a temporary laboratory site, set up in a fixed location operating for a limited and predefined period. Cat. II: Tests performed using a mobile laboratory vehicle specifically equipped to carry out certain tests. Cat. III: Tests performed by laboratory personnel at locations outside the laboratory premises.

QUESTIONNAIRE RESPONSES

Phase 3 Resident Questionnaire Answers

Location ID	Q1 Use of weed suppressants	Q2 Placement of astro turf or faux grass	Q3 Landscaping works undertaken	Q4 Imported or exported topsoil	Q5 Use of soil additives	Q6 Use of chemical fertilisers / pesticides	Q7 How plants are watered	Q8 Details of garden distribution	Council Q Do you grow vegetables for consumption
GR03-SP301	No	Yes	Yes- Perimeter turfed	No	No	No		Grass, patio	Yes
GR03-SP302	No	No	No	No	No	No	No watering	Grass, geotextile at the fence (0.3m)	No
GR03-SP303		No	No	No	No	No		Grass, patio, flowerbeds	Yes
GR03-SP304	No	No	Yes (raised gardens 13 yrs)	None	Yes (added every 6 months)	None	Mains	Raised gardens, flower beds, patio, stones	No
GR03-SP305		No	No					Grass with area of slate shingle with driveway and footpath	No
GR03-SP306		No	No					Patio, decorative stone, grass	No
GR03-SP307	No	No	Yes - whole garden leveled and reseeded in 2024.	Yes	Yes	No	Mains hose/sprinkler	Patio, grass, drains and shed	No
GR03-SP308	No	No	Yes	No	No	No		Resident in a rush. Rear decking, grass lawn, stone patio and hot-tub	No
GR03-SP309		No	No					Grass, flowerbed, green house, tree, play area, shed	No
GR03-SP310		No	No					Grass, patio, flowerbeds	No
GR03-SP311	No	Yes	Yes - rear garden	Yes - rear garden	No	No		Driveway, grass and trees	Yes
GR03-SP312		No	No					Grass and patio	No
GR03-SP313		No	No					Gravel, decking and grass	No
GR03-SP314	No	No	No	Some bags of topsoil added, but not a distinctive layer		No	Mains watering can	Grass, patio, flowerbeds	No
GR03-SP315		No	No		No	No		Grass, driveway	No
GR03-SP316	Plastic	No	No. Observed compost added, beds covered and planters.	Compost/planters only	Compost added to beds			Red pointed planter, muslin, compost	No
GR03-SP317		No	No						Yes
GR03-SP318		Yes	No	Flower beds only	Flower beds only	No	Mains watering can	Grass, green house, flower bed	No
GR03-SP319	No	No	Previously landscaped 10years ago. Removed and levelled 2years ago. Topsoil added and seeded.	Imported topsoil. Removed hardcore		Green Thumb basic treatment package used 2 years ago	Mains water	Patio, grass, trampoline	No
GR03-SP320		No	No					Grass, paving flags, flowerbed	No
GR03-SP321	No	No	No (only topsoil added to flower beds)	Yes (topsoil added 2-3 yrs ago)	See Q4	None	No watering	Flower beds, topsoil around boundaries	No
GR03-SP322	No	No	No	No	No	No	No watering	Front garden, driveway, grassed area	No
GR03-SP323		No	No					grass with trees and footpath	No
GR03-SP324	Yes	No	No			Weed and Feed		Grass, footpath, flower beds and raised paved area	No
GR03-SP325	No	No	No	No	No	No	Mains hose/sprinkler	Patio, shrubs and grass	No
GR03-SP326		No	No						No
GR03-SP327	Herbicide	No	Yes (rear raised garden approximately 0.3m. Existing paving likely present at the original ground level)	None	No		No	Raised gravel, paving, hard-to-dig areas	No
GR03-SP328		No	No						No
GR03-SP329	No	Yes - astroturf in the back garden and centre of front garden.	Yes (flower beds, raised beds, pond)	None		No		Astro turf in back/front, flower beds, raised beds, pond	No
GR03-SP330		No	Yes					Grass with footpath and road adjacent	No
GR03-SP331		No	No	Yes - used to level back of rear garden and in flower borders.				Grass, path, flower bed	No
GR03-SP332	Yes	No	No		No	No	Mains	Weed suppressant under gravel, shed, patio, flower bed	No
GR03-SP333		No	No						Yes

	Q1	Q2	Q3	Q4	Q5	Q6	Q7	Q8	Council Q
Location ID	Use of weed suppressants	Placement of astro turf or faux grass	Landscaping works undertaken	Imported or exported topsoil	Use of soil additives	Use of chemical fertilisers / pesticides	How plants are watered	Details of garden distribution	Do you grow vegetables for consumption
GR03-SP334	Herbicide	No	Occupied property for 15 yrs. Landscaping works to remove flag stones and replace with turf.	New turf and topsoil added to level back and side garden about 10 yrs ago.	Topsoil added to level garden.	Yes - Greenthumb treatment 3 times a year - pellets of fertiliser/weed killer.		New turf, topsoil, no diagram	No
GR03-SP335	No	No	No (only work to flower beds)	No	No	No		Flower beds, lawn, driveway, concrete path	No
GR04-SP401	No	No	No	No	No	No	No watering	Patio, shed, grass	No
GR04-SP403		No	No	No	No				No
GR04-SP406		No	Yes	Yes - 6 inches placed on original ground level. 35 yrs ago.		No	Mains hose/sprinkler	Raised grass, patio, flowerbeds	No
GR04-SP408		Rear only	No	No				Sampled from front garden only. Grass, tree	No
GR04-SP409	No	No	Not during current occupancy - lawn was already raised	No	No	No	No watering	Gravel, patio, raised grass with shrubs	No
GR04-SP410		No	No					Patio, grass, beds and shed	No
GR04-SP411	No	Temporary mats	No	No	No	No			No
GR04-SP412		No	No					Patio, grass, hedges, water	No
GR04-SP413	No	No	No - no changes since January 2012.	Compost/manure in boarders only.	Compost/manure in boarders.	Fungus/blackspot spray on roses and weeds on patio.	Mains and water butt	Patio, grass, shrubs and footpath	No
GR04-SP415	Geotextile	No	No	No					No
GR04-SP416		No	No					Patios, footpaths, grass, boarder with trees	No
GR04-SP417		No	No						No
GR04-SP419	No	No	Yes	No	No	No		Grass, flowerbed, pond	No
GR04-SP420		No	No					Grass, path	Yes
GR04-SP421		No	No						No
GR04-SP422		No	No					Grass, flower bed, patio, gravel area	No
GR04-SP423	No	No	No	No	No	No	No watering	Driveway	No
GR04-SP425	No	No	No					Grass, concrete path, decking	No
GR04-SP426	No	No	No - not for 26 yrs.	No. Occasional scattering of grow bags more than 10 years ago.	No	No	No watering		Yes
GR04-SP427	Yes	No	Yes	Yes, topsoil/turf	Yes	Minimal	Mains watering can	Area of new grass, gravel, concrete	Yes
GR04-SP429		No	No	No				Grass, beds	No
GR04-SP430	No	No	No	No	No	No		Grass, patio, raised patio	No
GR04-SP434		No	Yes - portions of the garden <5 years ago to increase lawn size. Encountered concrete beneath grass.	Yes - to increase lawn area in the northwest corner of the front garden.	No	No	Mains watering can	Grass, patio	No
GR04-SP435	No	No	No	No	No	No	Mains watering can	Grass, footpath and treeline	Yes
GR04-SP436		No	No	No	No	No	Mains watering can		No
GR04-SP437		No	Yes, 18 years ago.	Yes	Yes			Grass, greenhouse and shed with drain cover	Yes
GR04-SP438	No	No	No	No	No	Yes- Garden centre 'weed and feed' twice a year	Mains watering can	Grass, patio	No
GR04-SP439	No	No	Yes, rear garden only.	Only in flower beds		No	Mains watering can	Grass, flower bed, driveway	No
GR04-SP440	No	No	No	No	No	No		Grass with tree, patio, flowerbed	No
GR04-SP441	No	No	No	No	No	No	Mains hose/sprinkler	Patio, grass with tree.	No
GR04-SP442		No	No					Grass, path, driveway	No

Appendix I

wsp

APPENDIX I - GLOSSARY OF TERMS – PROPERTY SUMMARIES

M bgl	Meters below ground level – a unit of measured used to communicate depths of geological features.
EFSA 4 PFAS (PFOA, PFOS, PFNA and PFHxS)	Four PFAS selected by the European Food Safety Authority (EFSA) for the assessment of risk to human health from PFAS.
PFAS Broad Suite	There are many compounds within the PFAS group. The Broad Suite is a laboratory analytical package that comprises 50 individual PFAS compounds most frequently used by industry and found in the environment.
PFOA linear and branched isomers	The PFOA compound contains individual elements such as carbon, fluorine and oxygen which can be positioned in two dominants forms. The same number of elements are present in both forms of the compound. The different forms are called isomers. The linear isomer - elements are positioned side-by-side as a chain. The branched isomer - elements are positioned in small individual groups forming ‘branches’ along a carbon backbone.
Cross contamination	A process whereby a potentially contaminating substance is inadvertently moved from one location to another and impacting a sample that otherwise would not be considered contaminated.
Rinsate (equipment blank)	A quality assurance / quality control (QA/QC) process involving laboratory analysis of laboratory supplied PFAS free water. The PFAS free rinse water was poured over the sampling equipment after cleaning and collected for analysis to check the sufficiency of the equipment cleaning process between samples and individual sample pits.
Duplicate	A quality assurance / quality control (QA/QC) process involving obtaining a second soil sample obtained from the same soil at the same time using the same sampling equipment. The second and original sample are both analysed in a laboratory and the results compared for differences. Duplicate samples were collected from the same pit and from an additional duplicate pit dug immediately adjacent to the original pit. The original pit has been identified as “S1” and the duplicate pit as “S2” in this investigation.
Sampling precision	Assesses the similarities between samples in terms of the physical characteristics and profile.
Analytical precision	Assesses the repeatability of laboratory processes and capabilities of analytical machinery.
Relative percentage difference (RPD)	A measure of statistical difference between two samples. The results of the original sample and duplicate sample are compared by expressing how far apart they are relative to their average. The ratio is expressed as a percentage.
Limit of detection (LOD)	The lowest amount of a substance that a laboratory analytical method can reliably distinguish from a blank result (no substance at all present). The limit of detection is dependent on the technological advancement and scientific capability of the laboratory.

µg/kg / µg/l	Units of measurement: 1 µg/kg means one microgram of a substance in one kilogram of soil. 1 µg/l means one microgram of a substance dissolved in one litre of water.
Soil Organic Matter (SOM)	Soil Organic Matter is a measure of the naturally forming organic component of soil which includes humus, decomposing vegetation and living organisms. Certain organic chemicals strongly bind to SOM resulting in a positive correlation between SOM concentration and chemical concentration.
pH	pH is a measure of the acidity or basicity of the soil. pH controls how a substance behaves in the environment and what chemical reactions may occur.
Phase 2	Investigation phase undertaken in February to March 2025
Phase 3	Investigation phase undertaken in October to November 2025
Logs	In ground engineering, geology and observed ground characteristics are recorded and communicated graphically using 'logs'. For this project the logs include a description of the geology against specific depth intervals, list samples obtained, groundwater occurrences, the method of investigation and key findings.
Made Ground	Soil and or ground which has been placed, reworked, or significantly modified by human activity. Made ground typically contains inclusions of man-made materials such as brick, concrete, plastic or glass alongside natural forming materials such as plant humus, clay, sand, and gravel of sandstone, flint or mudstone.
Anthropogenic materials	These comprise materials only produced by man such as brick, concrete and plastic, and would not be considered naturally occurring.
Potentially reworked natural	Soil and or ground that exhibits naturally occurring characteristics or evidence of natural geological processes. The position or location of the soil indicates that the material may have been disturbed such as a rear garden. Natural material may have been excavated and stockpiled during construction of a residential development and returned to the garden when completed.
Ground penetrating radar (GPR)	A device that uses high-frequency electromagnetic pulses to create images of the subsurface. It utilises geophysical principals to detect buried objects and layers of geology by measuring how radar waves reflect off boundaries between different materials. The technology was using during this investigation to detect below ground utility services.
British Standard	British Standards are formally developed, consensus-based documents published by the British Standards Institution (BSI). It is a requirement in engineering to conform to British Standards, when applicable, to ensure work is completed to the required quality, safety and reliability standard.

PFAS Results - Detailed Phase: October 2025

Duplicate RPDs in soil samples (ug/kg)

RPD % shown in red highlights samples where the variance is greater than +/- 50% (which would be within the range expected for heterogeneous Made Ground soils)

RPD % Sampling Precision
GR03-SP324-A

[illegible]

PFAS Results - Detailed PI
Duplicate RPDs in soil sam
RPD % shown in red highlig

06/02/2026 2 of 16 Prepared by WSP on behalf of the Environment Agency

Thornton Phase :

PFAS Results - Detailed PI
Duplicate RPDs in soil sam
RPD % shown in red highliq
